Chapter 3 Port Status and Configuration

Viewing port status and configuring port parameters

Connecting transceivers to fixed-configuration devices
Viewing port status and configuration (CLI)
  Dynamically updating the show interfaces command (CLI/Menu)
Customizing the show interfaces command (CLI)
  Error messages associated with the show interfaces command
show interface smartrate
  Operating notes for viewing port utilization statistics
Viewing transceiver status (CLI)
  Operating Notes
Enabling or disabling ports and configuring port mode (CLI)
Enabling or disabling flow control (CLI)
Port shutdown with broadcast storm
  Viewing broadcast storm
SNMP MIB
  Overview
  fault-finder multicast-storm
  fault-finder multicast-storm action
  show logging
  Restrictions
Configuring auto-MDIX
  Manual override
  Configuring auto-MDIX (CLI)
Using friendly (optional) port names
  Configuring and operating rules for friendly port names
  Configuring friendly port names (CLI)
  Configuring a single port name (CLI)
  Configuring the same name for multiple ports (CLI)
Displaying friendly port names with other port data (CLI)
  Listing all ports or selected ports with their friendly port names (CLI)
  Including friendly port names in per-port statistics listings (CLI)
  Searching the configuration for ports with friendly port names (CLI)
Uni-directional link detection (UDLD)
  Configuring UDLD
  Configuring uni-directional link detection (UDLD) (CLI)
  Enabling UDLD (CLI)
  Changing the keepalive interval (CLI)
  Changing the keepalive retries (CLI)
Chapter 4 Power Over Ethernet (PoE/PoE+) Operation ..................106

Introduction to PoE ..................................................106
PoE terminology ....................................................106
Planning and implementing a PoE configuration ..................106
Power requirements .................................................106
Assigning PoE ports to VLANs .................................106
Applying security features to PoE configurations ...............107
Assigning priority policies to PoE traffic .........................107
PoE operation ..........................................................107
Configuration options ..............................................107
PD support ..............................................................108
Power priority operation ...........................................108
  When is power allocation prioritized? ..........................108
  How is power allocation prioritized? ............................109
Configuring PoE operation ........................................109
Disabling or re-enabling PoE port operation .....................109
Enabling support for pre-standard devices ......................109
Configuring the PoE port priority ................................110
Controlling PoE allocation ........................................110
Manually configuring PoE power levels .........................111
Configuring PoE redundancy .....................................112
Changing the threshold for generating a power notice ..........113
PoE/PoE+ allocation using LLDP information .................114
LLDP with PoE ......................................................114
  Enabling or disabling ports for allocating power using LLDP 115
  Enabling PoE detection via LLDP TLV advertisement ....115
LLDP with PoE+ .....................................................115
  Overview ..........................................................115
  PoE allocation ....................................................115
  Viewing PoE when using LLDP information .................116
Operating note .......................................................118
Viewing the global PoE power status of the switch ..........118
  Viewing PoE status on all ports ...............................119
  Viewing the PoE status on specific ports ....................121
PoE Event Log messages ..........................................122
Chapter 5 Port Trunking

Overview of port trunking.............................................................. 123
Port connections and configuration............................................ 123
Port trunk features and operation.............................................. 124
Fault tolerance............................................................................ 124
Trunk configuration methods.................................................... 124
Dynamic LACP trunk................................................................ 124
Using keys to control dynamic LACP trunk configuration........ 124
Static trunk.............................................................................. 125
Viewing and configuring port trunk groups (CLI)....................... 129
Viewing static trunk type and group for all ports or for selected ports.................................................. 129
Viewing static LACP and dynamic LACP trunk data.............. 130
Dynamic LACP Standby Links.................................................. 130
Configuring a static trunk or static LACP trunk group.............. 131
Removing ports from a static trunk group......................... 131
Enabling a dynamic LACP trunk group............................... 132
Removing ports from a dynamic LACP trunk group.............. 132
Viewing existing port trunk groups (WebAgent).................... 133
Trunk group operation using LACP..................................... 133
Default port operation............................................................ 135
LACP notes and restrictions.................................................... 137
802.1X (Port-based access control) configured on a port........ 137
Port security configured on a port......................................... 137
Changing trunking methods................................................... 137
Static LACP trunks................................................................. 137
Dynamic LACP trunks............................................................. 137
VLANs and dynamic LACP.................................................... 138
Blocked ports with older devices....................................... 138
Spanning Tree and IGMP........................................................ 139
Half-duplex, different port speeds, or both not allowed in LACP trunks........................................ 139
Dynamic/static LACP interoperation........................................ 139
Trunk group operation using the "trunk" option............. 139
How the switch lists trunk data.............................................. 139
Outbound traffic distribution across trunked links............... 140
Trunk load balancing using port layers.............................. 141
Enabling trunk load balancing.............................................. 141

Chapter 6 Port Traffic Controls

Rate-limiting............................................................................ 143
All traffic rate-limiting............................................................. 143
Configuring in/out rate-limiting............................................ 143
Displaying the current rate-limit configuration......................... 144
Operating notes for rate-limiting.......................................... 146
ICMP rate-limiting............................................................... 147
Guidelines for configuring ICMP rate-limiting....................... 148
Configuring ICMP rate-limiting............................................ 148
Using both ICMP rate-limiting and all-traffic rate-limiting on the same interface........................... 149
Viewing the current ICMP rate-limit configuration.............. 150
Operating notes for ICMP rate-limiting...................... 150
ICMP rate-limiting trap and Event Log messages..................... 151
Determining the switch port number used in ICMP port reset commands........................................ 152
Configuring inbound rate-limiting for broadcast and multicast traffic............................................ 153
Operating Notes..................................................................... 154
Guaranteed minimum bandwidth (GMB)

GMB operation.................................................................................................................. 155
Impacts of QoS queue configuration on GMB operation.................................................. 156
Configuring GMB for outbound traffic............................................................................ 157
Viewing the current GMB configuration............................................................................ 159
GMB operating notes....................................................................................................... 160
Impact of QoS queue configuration on GMB commands................................................. 160

Rate-limiting Unknown Unicast Traffic

rate-limit unknown-unicast in percent............................................................................ 160
rate-limit unknown-unicast in kbps................................................................................ 161
show rate-limit unknown-unicast.................................................................................... 162

Jumbo frames

Operating rules................................................................................................................... 163
Jumbo traffic-handling....................................................................................................... 163
Configuring jumbo frame operation

Overview............................................................................................................................ 165
Viewing the current jumbo configuration......................................................................... 165
Enabling or disabling jumbo traffic on a VLAN............................................................... 166
Configuring a maximum frame size

Configuring IP MTU.......................................................................................................... 167
SNMP implementation...................................................................................................... 167
Displaying the maximum frame size................................................................................ 167
Operating notes for maximum frame size......................................................................... 168

Troubleshooting.................................................................................................................. 168
A VLAN is configured to allow jumbo frames, but one or more ports drops all inbound
jumbo frames.................................................................................................................... 168
A non-jumbo port is generating "Excessive undersize/giant frames" messages in the
Event Log.......................................................................................................................... 168

Fault Finder

Fault Finder thresholds...................................................................................................... 169
Enabling Fault Finder....................................................................................................... 169

Chapter 7 Configuring for Network Management Applications..................................... 173

Using SNMP tools to manage the switch

SNMP management features.......................................................................................... 173
SNMPv1 and v2c access to the switch.............................................................................. 174
SNMPv3 access to the switch.......................................................................................... 174
Enabling and disabling switch for access from SNMPv3 agents.................................... 175
Enabling or disabling restrictions to access from only SNMPv3 agents......................... 175
Enabling or disabling restrictions from all non-SNMPv3 agents to read-only access....... 175
Viewing the operating status of SNMPv3........................................................................ 175
Viewing status of message reception of non-SNMPv3 messages.................................... 175
Viewing status of write messages of non-SNMPv3 messages......................................... 175
Enabling SNMPv3........................................................................................................... 175
SNMPv3 users.................................................................................................................. 176
Group access levels.......................................................................................................... 179
SNMPv3 communities....................................................................................................... 180
Listing community names and values (CLI).................................................................... 181
SNMP notifications.......................................................................................................... 183
Supported Notifications................................................................................................. 183
General steps for configuring SNMP notifications......................................................... 183
SNMPv1 and SNMPv2c Traps............................................................................................ 184
SNMP trap receivers........................................................................................................ 184
Overview......................................................................................................................... 185
SNMP trap when MAC address table changes............................................................... 186
Chapter 9 DHCPv6 server

DHCPv6 hardware address

DHCPv6 snooping and relay

dhcpv6-snooping

dhcpv6 snooping trust

dhcpv6–snooping authorized-server

Chapter 11 File Transfers........................................................................330

Overview..............................................................................................................330

Downloading switch software................................................................................330

General software download rules........................................................................330
Using TFTP to download software from a server.................................................330
Troubleshooting TFTP download failures.............................................................330
Downloading from a server to flash using TFTP (CLI)........................................330
Enabling TFTP (CLI).............................................................................................331
Configuring the switch to download software automatically from a TFTP server using auto-TFTP (CLI)..................................................................................332
Use USB to transfer files to and from the switch..................................................332
Using SCP and SFTP.............................................................................................332
Enabling SCP and SFTP.........................................................................................333
Disabling TFTP and auto-TFTP for enhanced security........................................333
Enabling SSH V2 (required for SFTP).................................................................333
Authentication......................................................................................................333
SCP/SFTP operating notes....................................................................................334
Troubleshooting SSH, SFTP, and SCP operations..............................................334
Using Xmodem to download switch software from a PC or UNIX workstation...334
Downloading to primary or secondary flash using Xmodem and a terminal emulator (CLI).................................................................335
Switch-to-switch download...................................................................................335
Download the OS from another switch (CLI)......................................................336
Using AirWave to update switch software..........................................................336
Using IMC to update switch software.................................................................336

Copying software images......................................................................................337
TFTP: Copying a software image to a remote host (CLI)....................................337
Xmodem: Copying a software image from the switch to a serially connected PC or UNIX workstation (CLI).........................................................338

Copying diagnostic data.......................................................................................339
copy command-log..............................................................................................339
copy event-log......................................................................................................340

Transferring switch configurations.....................................................................340
TFTP: Copying a configuration file to a remote host (CLI)..................................340
## Chapter 12 Monitoring and Analyzing Switch Operation

### Overview

- **Overview**

### Switch and network operations

- **Status and counters data**

  - **show system**
    - **chassisllocate**
    - **Chassisllocate at startup**
  - **General system information**
    - **Accessing system information (CLI)**
    - **Collecting processor data with the task monitor (CLI)**
      - **task-monitor cpu**
  - **Switch management address information access**
    - **show management**
  - **Component information views**
    - **show modules**
  - **Task usage reporting**
  - **Switch management address information**
    - **Accessing switch management address information (CLI)**
    - **Overview of MAC Address Management**
  - **Port Status**
    - **Viewing port status (CLI)**
    - **Viewing port and trunk group statistics (WebAgent)**
  - **Port and trunk group statistics and flow control status**
    - **Accessing port and trunk group statistics (CLI)**
    - **Displaying trunk load balancing statistics**
    - **Clearing trunk load balancing statistics**
    - **Resetting the port counters**
  - **Viewing the switch’s MAC address tables**

### Transferring ACL command files

- **TFTP: Copying a configuration file from a remote host (CLI)**
- **Xmodem: Copying a configuration file to a serially connected PC or UNIX workstation (CLI)**
- **Xmodem: Copying a configuration file from a serially connected PC or UNIX workstation (CLI)**
- **Transferring ACL command files**
- **TFTP: Uploading an ACL command file from a TFTP server (CLI)**
- **Xmodem: Uploading an ACL command file from a serially connected PC or UNIX workstation (CLI)**

### Single copy command

- **Single copy command**
- **Multiple management switches**
- **Stacking switches**
- **Standalone switches**
- **Crash file options**

### Flight Data Recorder (FDR)

- **USB**
- **show usb-port**
- **Download switch software using USB**
  - **Prerequisites**
- **Copying using USB**
  - **copy flash usb**
  - **copy usb command-file**

### Collecting processor data with the task monitor (CLI)

- **Task usage reporting**

### Port Status

- **Accessing switch management address information (CLI)**
- **Overview of MAC Address Management**
- **Viewing the switch’s MAC address tables**

### Contents

- **Contents**
- **USB**
- **Flight Data Recorder (FDR)**
- **Single copy command**
- **Transferring ACL command files**
- **Overview**
- **Switch and network operations**
- **Status and counters data**
- **Viewing the switch’s MAC address tables**
- **Contents**
Configuring a source switch in a remote mirroring session ................................................................. 397
Selecting all traffic on a port interface for mirroring according to traffic direction ............................ 398
Selecting all traffic on a VLAN interface for mirroring according to traffic direction ....................... 399
Configuring a MAC address to filter mirrored traffic on an interface .................................................. 400
Configuring classifier-based mirroring..................................................................................................... 401
Applying a mirroring policy on a port or VLAN interface ........................................................................ 403
Viewing a classifier-based mirroring configuration .................................................................................. 403
Viewing all mirroring session configured on the switch ........................................................................ 404
Viewing the remote endpoints configured on the switch ........................................................................ 404
Viewing the mirroring configuration for a specific session .................................................................... 405
Viewing a remote mirroring session ........................................................................................................ 406
Viewing a MAC-based mirroring session ................................................................................................ 407
Viewing a local mirroring session ............................................................................................................ 407
Viewing information on a classifier-based mirroring session ................................................................. 408
Viewing information about a classifier-based mirroring configuration .................................................... 408
Viewing information about a classifier-based mirroring configuration .................................................... 409
Viewing resource usage for mirroring policies ......................................................................................... 409
Viewing the mirroring configurations in the running configuration file ................................................ 410
Compatibility mode .................................................................................................................................. 410
Traffic mirroring overview ..................................................................................................................... 411
Mirroring overview .................................................................................................................................. 411
Mirroring destinations ............................................................................................................................... 412
Mirroring sources and sessions ................................................................................................................ 412
Mirroring sessions ..................................................................................................................................... 412
Mirroring session limits ............................................................................................................................. 413
Selecting mirrored traffic ......................................................................................................................... 413
Mirrored traffic destinations .................................................................................................................... 413
Local destinations ...................................................................................................................................... 414
Remote destinations .................................................................................................................................... 414
Monitored traffic sources .......................................................................................................................... 414
Criteria for selecting mirrored traffic ...................................................................................................... 414
Mirroring configuration ............................................................................................................................. 414
Remote mirroring endpoint and intermediate devices ............................................................................... 415
Remote mirroring overview ..................................................................................................................... 415
Quick reference to remote mirroring setup ............................................................................................. 416
High-level overview of the mirror configuration process ....................................................................... 416
Determine the mirroring session and destination .................................................................................... 416
For a local mirroring session .................................................................................................................... 416
For a remote mirroring session ................................................................................................................ 416
Configure a mirroring destination on a remote switch ........................................................................... 417
Configure a destination switch in a remote mirroring session ................................................................ 417
Configure a mirroring session on the source switch ............................................................................. 417
Configure a source switch in a remote mirroring session ....................................................................... 417
Configure the monitored traffic in a mirror session .............................................................................. 418
Traffic selection options ........................................................................................................................... 418
Mirroring-source restrictions .................................................................................................................... 418
About selecting all inbound/outbound traffic to mirror .......................................................................... 419
Untagged mirrored packets ....................................................................................................................... 419
About using SNMP to configure no-tag-added ....................................................................................... 419
Operating notes .......................................................................................................................................... 420
About selecting inbound/outbound traffic using a MAC address ............................................................. 420
About selecting inbound traffic using advanced classifier-based mirroring ............................................ 421
Classifier-based mirroring configuration ............................................................................................... 422
Classifier-based mirroring restrictions ................................................................................................... 423
About applying multiple mirroring sessions to an interface ................................................................... 424
Mirroring configuration examples .......................................................................................................... 425
Chapter 13 Troubleshooting

Overview...........................................................................................................................................444

Troubleshooting approaches..............................................................................................................444

Browser or Telnet access problems......................................................................................................445

Cannot access the WebAgent................................................................................................................445

Cannot Telnet into the switch console from a station on the network.............................................445

Unusual network activity.......................................................................................................................446

General problems...............................................................................................................................446

The network runs slow; processes fail; users cannot access servers or other devices.................446

Duplicate IP addresses.......................................................................................................................446

Duplicate IP addresses in a DHCP network.......................................................................................446

The switch has been configured for DHCP/Bootp operation, but has not received a DHCP or Bootp reply...........................................................................................................................................447

802.1Q Prioritization problems.............................................................................................................447

Ports configured for non-default prioritization (level 1 to 7) are not performing the specified action...........................................................................................................................................447

Addressing ACL problems...................................................................................................................447

ACLs are properly configured and assigned to VLANs, but the switch is not using the ACLs to filter IP layer 3 packets...........................................................................................................................................447

The switch does not allow management access from a device on the same VLAN..................448

Error (Invalid input) when entering an IP address........................................................................448

Apparent failure to log all "deny" matches.........................................................................................448

The switch does not allow any routed access from a specific host, group of hosts, or subnet......449

The switch is not performing routing functions on a VLAN..............................................................449

Routing through a gateway on the switch fails................................................................................449

IGMP-related problems.......................................................................................................................450

IP multicast (IGMP) traffic that is directed by IGMP does not reach IGMP hosts or a multicast router connected to a port...........................................................................................................................................450

IP multicast traffic floods out all ports; IGMP does not appear to filter traffic............................450

LACP-related problems.......................................................................................................................450

Unable to enable LACP on a port with the interface <port-number> lACP command.................451

Port-based access control (802.1X)-related problems.....................................................................451

The switch does not receive a response to RADIUS authentication requests............................451

The switch does not authenticate a client even though the RADIUS server is properly configured and providing a response to the authentication request.........................................................451

During RADIUS-authenticated client sessions, access to a VLAN on the port used for the client sessions is lost..........................................................451
The switch appears to be properly configured as a supplicant, but cannot gain access to the intended authenticator port on the switch to which it is connected ........................................ 452
The supplicant statistics listing shows multiple ports with the same authenticator MAC address......................................................................................................................... 452
The show port-access authenticator <port-list> command shows one or more ports remain open after they have been configured with control unauthorized .................................................................................................................. 452
RADIUS server fails to respond to a request for service, even though the server’s IP address is correctly configured in the switch ........................................................................................................ 452
The authorized MAC address on a port that is configured for both 802.1X and port security either changes or is re-acquired after execution of aaa port-access authenticator <port-list> initialize ......................................................... 453
A trunked port configured for 802.1X is blocked .......................................................................................................................... 453
QoS-related problems........................................................................................................................................................................ 453
Loss of communication when using VLAN-tagged traffic ............................................................................................................. 453
Radius-related problems...................................................................................................................................................................... 453
The switch does not receive a response to RADIUS authentication requests .................................................................................. 453
RADIUS server fails to respond to a request for service, even though the server’s IP address is correctly configured in the switch............................................................................................................ 454
MSTP and fast-uplink problems.................................................................................................................................................................. 454
Broadcast storms appearing in the network ................................................................................................................................. 454
STP blocks a link in a VLAN even though there are no redundant links in that VLAN ........................................................................... 454
Fast-uplink troubleshooting ............................................................................................................................................................ 455
SSH-related problems........................................................................................................................................................................ 455
Switch access refused to a client .......................................................................................................................................................... 455
Executing IP SSH does not enable SSH on the switch .......................................................................................................................... 455
Switch does not detect a client’s public key that does appear in the switch’s public key file (show ip client-public-key) .................................................................................................................................................. 455
An attempt to copy a client public-key file into the switch has failed and the switch lists one of the following messages .......................................................................................................................... 455
Client ceases to respond (“hangs”) during connection phase ........................................................................................................ 456
TACACS-related problems.................................................................................................................................................................. 456
Event Log......................................................................................................................................................................................... 456
All users are locked out of access to the switch .................................................................................................................................. 456
No communication between the switch and the TACACS+ server application .................................................................................. 456
Access is denied even though the username/password pair is correct .......................................................................................... 457
Unknown users allowed to login to the switch ................................................................................................................................. 457
System allows fewer login attempts than specified in the switch configuration ..................................................................................... 457
TimeP, SNTP, or Gateway problems .................................................................................................................................................. 457
The switch cannot find the time server or the configured gateway ........................................................................................................... 457
VLAN-related problems...................................................................................................................................................................... 457
Monitor port......................................................................................................................................................................................... 457
None of the devices assigned to one or more VLANs on an 802.1Q-compliant switch are being recognized ........................................ 458
Link configured for multiple VLANs does not support traffic for one or more VLANs................................................................. 458
Duplicate MAC addresses across VLANs .......................................................................................................................................... 458
Disabled overlapping subnet configuration .......................................................................................................................................... 459
Fan failure......................................................................................................................................................................................... 460
Mitigating flapping transceivers.......................................................................................................................................................... 460
Fault-finder link-flap ............................................................................................................................................................................. 461
Show fault-finder link-flap ................................................................................................................................................................. 463
Event Log.......................................................................................................................................................................................... 464
Restrictions......................................................................................................................................................................................... 464
Viewing transceiver information.......................................................................................................................................................... 464
Viewing information about transceivers (CLI) ........................................................................................................................................ 466
MIB support......................................................................................................................................................................................... 466
Restoring the factory-default configuration .......................... 527
  Resetting the factory-default configuration .......................... 528
  Using the CLI ................................................................. 528
  Using Clear/Reset .......................................................... 528
Restoring a flash image ...................................................... 528
  Recovering from an empty or corrupted flash state ................. 528
DNS resolver ........................................................................ 530
  Basic operation .............................................................. 530
  Configuring and using DNS resolution with DNS-compatible commands ............................................ 532

This guide provides information on how to configure, manage, and monitor basic switch operation.

**Applicable products**

This guide applies to these products:

**Switch prompts used in this guide**

Examples in this guide are representative and may not match your particular switch/environment. Examples use simplified prompts as follows:

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch#</td>
<td># indicates manager context (authority).</td>
</tr>
<tr>
<td>switch&gt;</td>
<td>&gt; indicates operator context (authority).</td>
</tr>
<tr>
<td>switch(config)#</td>
<td>(config) indicates the config context.</td>
</tr>
<tr>
<td>switch(vlan-x)#</td>
<td>(vlan-x) indicates the vlan context of config, where x represents the VLAN ID. For example: switch(vlan-128)#.</td>
</tr>
<tr>
<td>switch(eth-x)#</td>
<td>(eth-x) indicates the interface context of config, where x represents the interface. For example: switch(eth-48)#.</td>
</tr>
<tr>
<td>switch-Stack#</td>
<td>Stack indicates that stacking is enabled.</td>
</tr>
<tr>
<td>switch-Stack(config)#</td>
<td>Stack(config) indicates the config context while stacking is enabled.</td>
</tr>
<tr>
<td>switch-Stack(stacking)#</td>
<td>Stack(stacking) indicates the stacking context of config while stacking is enabled.</td>
</tr>
<tr>
<td>switch-Stack(vlan-x)#</td>
<td>Stack(vlan-x) indicates the vlan context of config while stacking is enabled, where x represents the VLAN ID. For example: switch-Stack(vlan-128)#.</td>
</tr>
<tr>
<td>switch-Stack(eth-x/y)#</td>
<td>Stack(eth-x/y) indicates the interface context of config, in the form (eth-&lt;member-in-stack&gt;/&lt;interface&gt;). For example: switch(eth-1/48)#.</td>
</tr>
</tbody>
</table>
NOTE:
For successful time protocol setup and specific configuration details, you may need to contact your system administrator regarding your local configuration.

General steps for running a time protocol on the switch

Using time synchronization ensures a uniform time among interoperating devices. This helps you to manage and troubleshoot switch operation by attaching meaningful time data to event and error messages.

The switch offers TimeP, SNTP (Simple Network Time Protocol), NTP, and a `timesync` command for changing the time protocol selection (or turning off time protocol operation).

NOTE: Although you can create and save configurations for all time protocols without conflicts, the switch allows only one active time protocol at any time.

In the factory-default configuration, time synchronization is disabled by default.

NOTE: Because the Aruba 2930F Switch does not contain an RTC (real time clock) chip, Hewlett Packard Enterprise recommends configuring one of the time synchronization protocols supported. Failure to do so could result in the switch time being reset to the factory default of 01/01/1990 00:00:00 in the case of a switch reload, software upgrade, or power cycle.

TimeP time synchronization

You can either manually assign the switch to use a TimeP server or use DHCP to assign the TimeP server. In either case, the switch can get its time synchronization updates from only one designated TimeP server. This option enhances security by specifying which time server to use.

SNTP time synchronization

SNTP provides three operating modes:

• **Broadcast mode**
  The switch acquires time updates by accepting the time value from the first SNTP time broadcast detected. (In this case, the SNTP server must be configured to broadcast time updates to the network broadcast address; see the documentation provided with your SNTP server application.) Once the switch detects a particular server, it ignores time broadcasts from other SNTP servers unless the configurable Poll Interval expires three consecutive times without an update received from the first-detected server.

  NOTE: To use Broadcast mode, the switch and the SNTP server must be in the same subnet.

• **DHCP mode**
  DHCP mode is enabled by default. In DHCP mode, the SNTP server address and the timezone are provided in the DHCP address reply.

• **Unicast mode**
  The switch requests a time update from the configured SNTP server. (You can configure one server using the menu interface, or up to three servers using the CLI `sntp server` command.) This option provides increased
security over the Broadcast mode by specifying which time server to use instead of using the first one detected through a broadcast.

**NTP time synchronization**

The Network Time Protocol (NTP) synchronizes the time of day among a set of distributed time servers and clients in order to correlate events when receiving system logs and other time-specific events from multiple network devices. NTP uses the User Datagram Protocol (UDP) as its transport protocol.

**timesync Command**

This command is used to configure the protocol used for network time synchronization.

**Syntax**

```
[no] timesync { timep | sntp | timep-or-sntp | ntp }
```

**Options**

- **no**
  Deletes all timesync configurations on the device.
- **timep**
  Updates the system clock using TIMEP.
- **sntp**
  Updates the system clock using SNTP.
- **timep-or-sntp**
  Updates the system clock using TIMEP or SNTP (default).
- **ntp**
  Updates the system clock using NTP

**Example**

```
switch(config)# timesync
sntp              Update the system clock using SNTP.
timep             Update the system clock using TIMEP.
sntp              Update the system clock using SNTP.
timep-or-sntp     Update the system clock using TIMEP or SNTP.
ntp                Update the system clock using NTP.
```

**Selecting a time synchronization protocol**

**Procedure**

1. Select the time synchronization protocol: TimeP, SNTP, or NTP.
2. Enable the protocol; the choices are:
   a. **TimeP**: DHCP or Manual
   b. **SNTP**: Broadcast or Unicast
   c. **NTP**: Broadcast or Unicast
3. Configure the remaining parameters for the time protocol you selected.
The switch retains the parameter settings for both time protocols even if you change from one protocol to the other. Thus, if you select a time protocol, the switch uses the parameters you last configured for the selected protocol.

Simply selecting a time synchronization protocol does not enable that protocol on the switch unless you also enable the protocol itself (step 2, above). For example, in the factory-default configuration, TimeP is the selected time synchronization method. However, because TimeP is disabled in the factory-default configuration, no time synchronization protocol is running.

**Disabling time synchronization**

You can execute `no timesync` (global config level of the CLI) to disable time synchronization without changing the TimeP, SNTP, or NTP configuration.

**TimeP: Selecting and configuring**

The following table shows TimeP parameters and their operations.

### Table 1: *TimeP parameters*

<table>
<thead>
<tr>
<th>TimeP parameter</th>

<tr>
<td>Time Sync Method</td>
<td>Used to select either TIMEP, SNTP, NTP, or None as the time synchronization method.</td>
</tr>
<tr>
<td>TimeP Mode</td>
<td></td>
</tr>
<tr>
<td>Disabled</td>
<td>TimeP does not operate, even if specified by the Menu interface <em>Time Sync Method</em> parameter or the CLI <code>timesync</code> command.</td>
</tr>
<tr>
<td>DHCP</td>
<td>When TimeP is selected as the time synchronization method, the switch attempts to acquire a TimeP server IP address via DHCP. If the switch receives a server address, it polls the server for updates according to the TimeP poll interval. If the switch does not receive a TimeP server IP address, it cannot perform time synchronization updates.</td>
</tr>
<tr>
<td>Manual</td>
<td>When TimeP is selected as the time synchronization method, the switch attempts to poll the specified server for updates according to the TimeP poll interval. If the switch fails to receive updates from the server, time synchronization updates do not occur.</td>
</tr>
<tr>
<td>Server Address</td>
<td>Used only when the <em>TimeP Mode</em> is set to Manual. Specifies the IP address of the TimeP server that the switch accesses for time synchronization updates. You can configure one server.</td>
</tr>
</tbody>
</table>

**Viewing the current TimeP configuration (CLI)**

Using different `show` commands, you can display either the full TimeP configuration or a combined listing of all TimeP, SNTP, and VLAN IP addresses configured on the switch.

**Syntax:**

```
show timep
```

Lists both the time synchronization method (TimeP, SNTP, or None) and the TimeP configuration, even if SNTP is not the selected time protocol. (If the TimeP Mode is set to `Disabled` or `DHCP`, the Server field does not appear.)
If you configure the switch with TimeP as the time synchronization method, then enable TimeP in DHCP mode with the default poll interval, `show timep` lists the following:

**TimeP configuration when TimeP is the selected Time synchronization method**

```plaintext
switch(config)# show timep
Timep Configuration
  Time Sync Mode: Timep
  TimeP Mode [Disabled] : DHCP   Server Address : 10.10.28.103
  Poll Interval (min) [720] : 720
```

If SNTP is the selected time synchronization method, `show timep` still lists the TimeP configuration even though it is not currently in use. Even though, in this Example:, SNTP is the current time synchronization method, the switch maintains the TimeP configuration:

**TimeP configuration when TimeP is not the selected time synchronization method**

```plaintext
switch(config)# show timep
Timep Configuration
  Time Sync Mode: Snntp
  TimeP Mode [Disabled] : Manual   Server Address : 10.10.28.100
  Poll Interval (min) [720] : 720
```

**Syntax:**

`show management`

Helps you to easily examine and compare the IP addressing on the switch. It lists the IP addresses for all time servers configured on the switch plus the IP addresses and default gateway for all VLANs configured on the switch.

**Display showing IP addressing for all configured time servers and VLANs**

```plaintext
switch(config)# show management
Status and Counters - Management Address Information
  Time Server Address : 10.10.28.100

<table>
<thead>
<tr>
<th>Priority</th>
<th>SNTP Server Address</th>
<th>Protocol Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10.10.28.101</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>10.255.5.24</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>fe80::123%vlan10</td>
<td>3</td>
</tr>
</tbody>
</table>

Default Gateway : 10.0.9.80

<table>
<thead>
<tr>
<th>VLAN Name</th>
<th>MAC Address</th>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT VLAN</td>
<td>001279-88a100</td>
<td>10.30.248.184</td>
</tr>
<tr>
<td>VLAN10</td>
<td>001279-88a100</td>
<td>10.0.10.17</td>
</tr>
</tbody>
</table>
```
Configuring (enabling or disabling) the TimeP mode

Enabling the TimeP mode means to configure it for either broadcast or unicast mode. Remember to run TimeP as the switch's time synchronization protocol, you must also select TimeP as the time synchronization method by using the CLI `timesync` command.

**Syntax:**

```
timesync timep
```

Selects TimeP as the time synchronization method.

**Syntax:**

```
[no] ip timep {<dhcp | manual>}
```

Enables the selected TimeP mode.

**Syntax:**

```
[ip timep manual <ip-addr>]
```

Activates TimeP in manual mode with a specified TimeP server. (The switch allows only one TimeP server.)

**Syntax:**

```
no ip timep
```

Disables TimeP.

**Enabling TimeP in DHCP Mode**

Because the switch provides a TimeP polling interval (default:720 minutes), you need only these two commands for a minimal TimeP DHCP configuration:

**Syntax:**

```
timesync timep
```

---

---
Selects TimeP as the time synchronization method.

**Syntax:**

```plaintext
ip timep dhcp
```

Configures DHCP as the TimeP mode.

For example, suppose:

- Time Synchronization is configured for SNTP.
- You want to:
  - View the current time synchronization.
  - Select TimeP as the synchronization mode.
  - Enable TimeP for DHCP mode.
  - View the TimeP configuration.

---

**Enabling TimeP in Manual Mode**

Like DHCP mode, configuring TimeP for Manual Mode enables TimeP. However, for manual operation, you must also specify the IP address of the TimeP server. (The switch allows only one TimeP server.) To enable the TimeP protocol:

**Syntax:**

```plaintext
timesync timep
```

Selects TimeP.

**Syntax:**

```plaintext
ip timep manual <ip-addr>
```

Activates TimeP in manual mode with a specified TimeP server.

**Syntax:**

```plaintext
[no] ip timep
```

Disables TimeP.

---

**NOTE:**
To change from one TimeP server to another, you must use the `no ip timep` command to disable TimeP mode, the reconfigure TimeP in manual mode with the new server IP address.

**Example:**
To select TimeP and configure it for manual operation using a TimeP server address of 10.28.227.141 and the default poll interval (720 minutes, assuming the TimeP poll interval is already set to the default):

```plaintext
switch(config)# timesync time
```

Selects TimeP.

```plaintext
switch(config)# ip timep manual 10.28.227.141
```

Activates TimeP in Manual mode.
Configuring TimeP for manual operation

switch(config)# timesync timep
switch(config)# ip timep manual 10.28.227.141
switch(config)# show timep

<table>
<thead>
<tr>
<th>Timep Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Sync Mode: Timep</td>
</tr>
<tr>
<td>TimeP Mode: Manual</td>
</tr>
<tr>
<td>Poll Interval (min): 720</td>
</tr>
</tbody>
</table>

Changing from one TimeP server to another (CLI)

Procedure

1. Use the `no ip timep` command to disable TimeP mode.

2. Reconfigure TimeP in Manual mode with the new server IP address.

Changing the TimeP poll interval (CLI)

Syntax:

`ip timep {< dhcp | manual >} interval <1-9999>`

Specifies how long the switch waits between time polling intervals. The default is 720 minutes and the range is 1 to 9999 minutes. (This parameter is separate from the `poll interval` parameter used for SNTP operation.)

Example:

To change the poll interval to 60 minutes:

```
switch(config)# ip timep interval 60
```

Disabling time synchronization without changing the TimeP configuration (CLI)

Syntax:

`no timesync`

Disables time synchronization by changing the `Time Sync Mode configuration` to `Disabled`. This halts time synchronization without changing your TimeP configuration. The recommended method for disabling time synchronization is to use the `timesync` command.

Example:

Suppose TimeP is running as the switch's time synchronization protocol, with DHCP as the TimeP mode, and the factory-default polling interval. You would halt time synchronization with this command:

```
switch(config)# no timesync
```

If you then viewed the TimeP configuration, you would see the following:

<table>
<thead>
<tr>
<th>TimeP with time synchronization disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timep Configuration</td>
</tr>
<tr>
<td>Time Sync Mode: Disabled</td>
</tr>
<tr>
<td>TimeP Mode: DHCP Poll Interval (min): 720</td>
</tr>
</tbody>
</table>
Disabling the TimeP mode

Syntax:

no ip timep

Disables TimeP by changing the TimeP mode configuration to Disabled and prevents the switch from using it as the time synchronization protocol, even if it is the selected Time Sync Method option.

Example:

If the switch is running TimeP in DHCP mode, no ip timep changes the TimeP configuration as shown below and disables time synchronization. Even though the TimeSync mode is set to TimeP, time synchronization is disabled because no ip timep has disabled the TimeP mode parameter.

<table>
<thead>
<tr>
<th>SNTP parameter</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Sync Method</td>
<td>Used to select either SNTP, TIMEP, NTP, or None as the time synchronization method.</td>
</tr>
</tbody>
</table>

### SNTP: Selecting and configuring

The following table shows the SNTP parameters and their operations.

**Table 2: SNTP parameters**

<table>
<thead>
<tr>
<th>SNTP Mode</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Disabled</strong></td>
<td>The Default. SNTP does not operate, even if specified by the Menu interface Time Sync Method parameter or the CLI timesync command.</td>
</tr>
<tr>
<td><strong>Unicast</strong></td>
<td>Directs the switch to poll a specific server for SNTP time synchronization. Requires at least one server address.</td>
</tr>
<tr>
<td><strong>Broadcast</strong></td>
<td>Directs the switch to acquire its time synchronization from data broadcast by any SNTP server to the network broadcast address. The switch uses the first server detected and ignores any others. However, if the Poll Interval expires three times without the switch detecting a time update from the original server, the switch accepts a broadcast time update from the next server it detects.</td>
</tr>
</tbody>
</table>

| Poll Interval (seconds) | In Unicast Mode: Specifies how often the switch polls the designated SNTP server for a time update. In Broadcast Mode: Specifies how often the switch polls the network broadcast address for a time update. Value is between 30 to 720 seconds. |

*Table Continued*
SNTP parameter | Operation
---|---
**Server Address** | Used only when the **SNTP Mode** is set to **Unicast**. Specifies the IP address of the SNTP server that the switch accesses for time synchronization updates. You can configure up to three servers; one using the menu or CLI, and two more using the CLI.

**Server Version** | Specifies the SNTP software version to use and is assigned on a per-server basis. The version setting is backwards-compatible. For example, using version 3 means that the switch accepts versions 1 through 3. Default: 3; range: 1 to 7.

**Priority** | Specifies the order in which the configured servers are polled for getting the time. Value is between 1 and 3.

### Viewing and configuring SNTP (CLI)

**Syntax:**

```
show sntp
```

Lists both the time synchronization method (**TimeP**, **SNTP**, or **None**) and the SNTP configuration, even if SNTP is not the selected time protocol.

If you configure the switch with SNTP as the time synchronization method, then enable SNTP in broadcast mode with the default poll interval, **show sntp** lists the following:

#### SNTP configuration when SNTP is the selected time synchronization method

```
switch(config)# show sntp

SNTP Configuration

   Time Sync Mode: Sntp
   SNTP Mode : Unicast
   Poll Interval (sec) [720] : 719

<table>
<thead>
<tr>
<th>Priority</th>
<th>SNTP Server Address</th>
<th>Protocol Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2001:db8::215:60ff:fe79:8980</td>
<td>7</td>
</tr>
<tr>
<td>2</td>
<td>10.255.5.24</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>fe80::123%vlan10</td>
<td>3</td>
</tr>
</tbody>
</table>
```

In the factory-default configuration (where TimeP is the selected time synchronization method), **show sntp** still lists the SNTP configuration, even though it is not currently in use. In **SNTP configuration when SNTP is not the selected time synchronization method** on page 36, even though TimeP is the current time synchronous method, the switch maintains the SNTP configuration.

#### SNTP configuration when SNTP is not the selected time synchronization method

```
switch(config)# show sntp

SNTP Configuration

   Time Sync Mode: Timep
   SNTP Mode : Unicast
   Poll Interval (sec) [720] : 719
```
<table>
<thead>
<tr>
<th>Priority</th>
<th>SNTP Server Address</th>
<th>Protocol Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2001:db8::215:60ff:fe79:8980</td>
<td>7</td>
</tr>
<tr>
<td>2</td>
<td>10.255.5.24</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>fe80::123%vlan10</td>
<td>3</td>
</tr>
</tbody>
</table>

Syntax:

show management

This command can help you to easily examine and compare the IP addressing on the switch. It lists the IP addresses for all time servers configured on the switch, plus the IP addresses and default gateway for all VLANs configured on the switch.

**Display showing IP addressing for all configured time servers and VLANs**

switch(config)# show management

Status and Counters - Management Address Information

Time Server Address : fe80::215:60ff:fe7a:adc%vlan10

<table>
<thead>
<tr>
<th>Priority</th>
<th>SNTP Server Address</th>
<th>Protocol Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2001:db8::215:60ff:fe79:8980</td>
<td>7</td>
</tr>
<tr>
<td>2</td>
<td>10.255.5.24</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>fe80::123%vlan10</td>
<td>3</td>
</tr>
</tbody>
</table>

Default Gateway : 10.0.9.80

VLAN Name    MAC Address     | IP address
------------- --------------- + ---------------
DEFAULT_VLAN 001279-88a100   | Disabled
VLAN10 001279-88a100         | 10.0.10.17

**Configuring (enabling or disabling) the SNTP mode**

Enabling the SNTP mode means to configure it for either broadcast or unicast mode. Remember that to run SNTP as the switch’s time synchronization protocol, you must also select SNTP as the time synchronization method by using the CLI `timesync` command.

**Syntax:**

timesync sntp

Selects SNTP as the time protocol.

sntp {<broadcast | unicast>}

Enables the SNTP mode.

**Syntax:**

sntp server <ip-addr>

Required only for unicast mode.
Syntax:

`snntp server priority <1-3>`

Specifies the order in which the configured servers are polled for getting the time. Value is between 1 and 3.

Syntax:

`snntp <30-720>`

Configures the amount of time between updates of the system clock via SNTP.

Default: 720 seconds

**Enabling SNTP in Broadcast Mode**

Because the switch provides an SNTP polling interval (default: 720 seconds), you need only these two commands for minimal SNTP broadcast configuration:

Syntax:

```
timesync snntp
```

Selects SNTP as the time synchronization method.

Syntax:

```
snntp broadcast
```

Configures broadcast as the SNTP mode.

**Example:**

Suppose that time synchronization is in the factory-default configuration (TimeP is the currently selected time synchronization method.) Complete the following:

**Procedure**

1. View the current time synchronization.
2. Select **SNTP** as the time synchronization mode.
3. Enable **SNTP** for Broadcast mode.
4. View the SNTP configuration again to verify the configuration.
The commands and output would appear as follows:

**Figure 1: Enabling SNTP operation in Broadcast Mode**

```bash
switch(config)# show sntp
SNTP Configuration
 Time Sync Mode: Timep
 SNTP Mode : disabled
 Poll Interval (sec) [720] :720

switch(config)# timesync sntp

switch(config)# sntp broadcast

switch(config)# show sntp
SNTP Configuration
 Time Sync Mode: Sntp
 SNTP Mode : Broadcast
 Poll Interval (sec) [720] :720
```

1. `show sntp` displays the SNTP configuration and also shows that TimeP is the currently active time synchronization mode.
2. `show sntp` again displays the SNTP configuration and shows that SNTP is now the currently active time synchronization mode and is configured for broadcast operation.

**Enabling SNTP in unicast mode (CLI)**

Like broadcast mode, configuring SNTP for unicast mode enables SNTP. However, for unicast operation, you must also specify the IP address of at least one SNTP server. The switch allows up to three unicast servers. You can use the Menu interface or the CLI to configure one server or to replace an existing unicast server with another. To add a second or third server, you must use the CLI. For more on SNTP operation with multiple servers, see [SNTP unicast time polling with multiple SNTP servers](#) on page 49.

**Syntax:**

```bash
timesync sntp
```

Selects SNTP as the time synchronization method.

**Syntax:**

```bash
sntp unicast
```

Configures the SNTP mode for unicast operation.

**Syntax:**

```bash
[no] sntp server priority < 1-3 > < ip-address > [version]
```

Use the `no` version of the command to disable SNTP.

**priority**

Specifies the order in which the configured SNTP servers are polled for the time.

**ip-address**

An IPv4 or IPv6 address of an SNTP server.
**version**

The protocol version of the SNTP server. Allowable values are 1 through 7; default is 3.

**Syntax:**

```plaintext
no sntp server priority <1-3> <ip-addr>
```

Deletes the specified SNTP server.

---

**NOTE:**

priority <1-3>

value must match what server is configured with. Deleting an SNTP server when only one is configured disables SNTP unicast operation.

---

**Example:**

To select SNTP and configure it with unicast mode and an SNTP server at 10.28.227.141 with the default server version (3) and default poll interval (720 seconds):

```plaintext
switch(config)# timesync sntp

Selects SNTP.

switch(config)# sntp unicast

Activates SNTP in unicast mode.

switch(config)# sntp server priority 1 10.28.227.141

Specifies the SNTP server and accepts the current SNTP server version (default: 3).
```

---

**Configuring SNTP for unicast operation**

```plaintext
switch(config)# show sntp

SNTP Configuration

<table>
<thead>
<tr>
<th>Priority</th>
<th>SNTP Server Address</th>
<th>Protocol Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2001:db8::215:60ff:fe79:8980</td>
<td>7</td>
</tr>
<tr>
<td>2</td>
<td>10.255.5.24</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>fe80::123%vlan10</td>
<td>3</td>
</tr>
</tbody>
</table>
```

In this Example, the **Poll Interval** and the **Protocol Version** appear at their default settings.

Both IPv4 and IPv6 addresses are displayed.

**Note:** Protocol Version appears only when there is an IP address configured for an SNTP server.

If the SNTP server you specify uses SNTP v4 or later, use the `sntp server` command to specify the correct version number. For example, suppose you learned that SNTP v4 was in use on the server you specified above (IP address 10.28.227.141). You would use the following commands to delete the server IP address, re-enter it with the correct version number for that server.
Specifying the SNTP protocol version number

switch(config)# no sntp server 10.28.227.141
switch(config)# sntp server 10.28.227.141 4
switch(config)# show sntp

SNTP Configuration

Time Sync Mode: Sntp
SNTP Mode : Broadcast
Poll Interval (sec) [720] : 600

<table>
<thead>
<tr>
<th>IP Address</th>
<th>Protocol Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.28.227.141</td>
<td>4</td>
</tr>
</tbody>
</table>

• 1 Deletes unicast SNTP server entry.
• 2 Re-enters the unicast server with a non-default protocol version.
• 3 show sntp displays the result.

Changing the SNTP poll interval (CLI)

Syntax:

sntp <30..720>

Specifies the amount of time between updates of the system clock via SNTP. The default is 720 seconds and the range is 30 to 720 seconds. (This parameter is separate from the poll interval parameter used for Timep operation.)

Example:

To change the poll interval to 300 seconds:

switch(config)# sntp 300

Changing the SNTP server priority (CLI)

You can choose the order in which configured servers are polled for getting the time by setting the server priority.

Syntax:

sntp server priority <1-3> <ip-address>

Specifies the order in which the configured servers are polled for getting the time. Value is between 1 and 3.

NOTE: You can enter both IPv4 and IPv6 addresses. For more information about IPv6 addresses, see the IPv6 configuration guide for your switch.

Example:

To set one server to priority 1 and another to priority 2:

switch(config)# sntp server priority 1 10.28.22.141
switch(config)# sntp server priority 2 2001:db8::215:60ff:fe79:8980
Disabling time synchronization without changing the SNTP configuration (CLI)

The recommended method for disabling time synchronization is to use the `timesync` command.

**Syntax:**

```
no timesync
```

Halts time synchronization without changing your SNTP configuration.

**Example:**

Suppose SNTP is running as the switch's time synchronization protocol, with `broadcast` as the SNTP mode and the factory-default polling interval. You would halt time synchronization with this command:

```
switch(config)# no timesync
```

If you then viewed the SNTP configuration, you would see the following:

---

### SNTP with time synchronization disabled

```
switch(config)# show sntp
SNTP Configuration
  Time Sync Mode: Disabled
  SNTP Mode : Broadcast
  Poll Interval (sec) [720] : 720
```

---

**Disabling the SNTP Mode**

If you want to prevent SNTP from being used even if it is selected by `timesync`, configure the SNTP mode as disabled.

**Syntax:**

```
no sntp
```

Disables SNTP by changing the SNTP mode configuration to `Disabled`.

**Example:**

If the switch is running SNTP in unicast mode with an SNTP server at 10.28.227.141 and a server version of 3 (the default), `no sntp` changes the SNTP configuration as shown below and disables time synchronization on the switch.

---

### Disabling time synchronization by disabling the SNTP mode

```
switch(config)# no sntp
switch(config)# show sntp
SNTP Configuration
  Time Sync Mode: Sntp
  SNTP Mode : disabled
  Poll Interval (sec) [720] : 600
  IP Address     Protocol Version
  --------------- ------------------
  10.28.227.141   3
```
Note that even though the Time Sync Mode is set to Sntp, time synchronization is disabled because no sntp has disabled the SNTP Mode parameter.

SNTP client authentication

Enabling SNTP authentication allows network devices such as switches to validate the SNTP messages received from an NTP or SNTP server before updating the network time. NTP or SNTP servers and clients must be configured with the same set of authentication keys so that the servers can authenticate the messages they send and clients (switches) can validate the received messages before updating the time.

This feature provides support for SNTP client authentication on switches, which addresses security considerations when deploying SNTP in a network.

Requirements

You must configure the following to enable SNTP client authentication on the switch.

SNTP client authentication support

- Timesync mode must be SNTP. Use the `timesync sntp` command. (SNTP is disabled by default).
- SNTP must be in unicast or broadcast mode. See Configuring unicast and broadcast mode for authentication on page 46.
- The MD5 authentication mode must be selected.
- An SNTP authentication key-identifier (`key-id`) must be configured on the switch and a value (`key-value`) must be provided for the authentication key. A maximum of 8 sets of `key-id` and `key-value` can be configured on the switch.
- Among the keys that have been configured, one key or a set of keys must be configured as trusted. Only trusted keys are used for SNTP authentication.
- If the SNTP server requires authentication, one of the trusted keys has to be associated with the SNTP server.
- SNTP client authentication must be enabled on the Switch. If client authentication is disabled, packets are processed without authentication.

All of the above steps are necessary to enable authentication on the client.

SNTP server authentication support

---

NOTE: SNTP server is not supported on Switch products.

---

You must perform the following on the SNTP server:

- The same authentication key-identifier, trusted key, authentication mode and key-value that were configured on the SNTP client must also be configured on the SNTP server.
- SNTP server authentication must be enabled on the server.

If any of the parameters on the server are changed, the parameters have to be changed on all the SNTP clients in the network as well. The authentication check fails on the clients otherwise, and the SNTP packets are dropped.

Configuring the key-identifier, authentication mode, and key-value (CLI)

This command configures the `key-id, authentication-mode, and key-value, which are required for authentication. It is executed in the global configuration context.
Syntax:

```
SNMP authentication key-id <key-id> authentication-mode <md5> key-value <key-string> [trusted]
```

```
no SNMP authentication key-id <key-id>
```

Configures a key-id, authentication-mode (MD5 only), and key-value, which are required for authentication. The no version of the command deletes the authentication key.

Default: No default keys are configured on the switch.

key-id

A numeric key identifier in the range of 1-4,294,967,295 (2^{32}) that identifies the unique key value. It is sent in the SNTP packet.

key-value <key-string>

The secret key that is used to generate the message digest. Up to 32 characters are allowed for key-string.

encrypted-key <<key-string>>

Set the SNTP authentication key value using a base64–encoded aes-256 encrypted string.

---

### Setting parameters for SNTP authentication

```
switch(config)# SNMPP authentication key-id 55 authentication-mode md5
key-value secretkey1
```

---

### Configuring a trusted key

Trusted keys are used in SNTP authentication. In unicast mode, you must associate a trusted key with a specific NTP/SNTP server. That key is used for authenticating the SNTP packet.

In unicast mode, a specific server is configured on the switch so that the SNTP client communicates with the specified server to get the date and time.

In broadcast mode, the SNTP client switch checks the size of the received packet to determine if it is authenticated. If the broadcast packet is authenticated, the key-id value is checked to see if the same key-id value is configured on the SNTP client switch. If the switch is configured with the same key-id value, and the key-id value is configured as "trusted," the authentication succeeds. Only trusted key-id value information is used for SNTP authentication. For information about configuring these modes, see Configuring unicast and broadcast mode for authentication on page 46.

If the packet contains key-id value information that is not configured on the SNTP client switch, or if the received packet contains no authentication information, it is discarded. The SNTP client switch expects packets to be authenticated if SNTP authentication is enabled.

When authentication succeeds, the time in the packet is used to update the time on the switch.

### Configuring a key-id as trusted (CLI)

Enter the following command to configure a key-id as trusted.

**Syntax:**

```
sntp authentication key-id <key-id> trusted
```

```
no sntp authentication key-id <key-id> trusted
```
Trusted keys are used during the authentication process. You can configure the switch with up to eight sets of key-id/key-value pairs. One specific set must selected for authentication; this is done by configuring the set as trusted.

The key-id itself must already be configured on the switch. To enable authentication, at least one key-id must be configured as trusted.

The no version of the command indicates the key is unreliable (not trusted).

Default: No key is trusted by default.

For detailed information about trusted keys, see Configuring a trusted key on page 44

**Associating a key with an SNTP server (CLI)**

**Syntax:**

```
[no] sntp server priority <1-3> {< ip-address | ipv6-address >} <version-num> [key-id <1-4,294,967,295>]
```

Configures a key-id to be associated with a specific server. The key itself must already be configured on the switch.

The no version of the command disassociates the key from the server. This does not remove the authentication key.

Default: No key is associated with any server by default.

**priority**

Specifies the order in which the configured servers are polled for getting the time.

**version-num**

Specifies the SNTP software version to use and is assigned on a per-server basis. The version setting is backwards-compatible. For example, using version 3 means that the switch accepts versions 1 through 3.

Default: 3; range: 1 - 7.

**key-id**

Optional command. The key identifier sent in the SNTP packet. This key-id is associated with the SNTP server specified in the command.

---

**Associating a key-id with a specific server**

```
switch(config)# sntp server priority 1 10.10.19.5 2 key-id 55
```

**Enabling SNTP client authentication**

The sntp authentication command enables SNTP client authentication on the switch. If SNTP authentication is not enabled, SNTP packets are not authenticated.

**Syntax:**

```
[no] sntp authentication
```

Enables the SNTP client authentication.

The no version of the command disables authentication.

Default: SNTP client authentication is disabled.
Configuring unicast and broadcast mode for authentication

To enable authentication, you must configure either unicast or broadcast mode. When authentication is enabled, changing the mode from unicast to broadcast or vice versa is not allowed; you must disable authentication and then change the mode.

To set the SNTP mode or change from one mode to the other, enter the appropriate command.

Syntax:

```bash
sntp unicast

sntp broadcast
```

Enables SNTP for either broadcast or unicast mode.

Default: SNTP mode is disabled by default. SNTP does not operate even if specified by the CLI `timesync` command.

### Unicast

Directs the switch to poll a specific server periodically for SNTP time synchronization. The default value between each polling request is 720 seconds, but can be configured. At least one manually configured server IP address is required.

**NOTE:** At least one key-id must be configured as trusted, and it must be associated with one of the SNTP servers. To edit or remove the associated key-id information or SNTP server information, SNTP authentication must be disabled.

### Broadcast

Directs the switch to acquire its time synchronization from data broadcast by any SNTP server to the network broadcast address. The switch uses the first server detected and ignores any others. However, if the Poll Interval (configurable up to 720 seconds) expires three times without the switch detecting a time update from the original server, the switch accepts a broadcast time update from the next server it detects.

**Viewing SNTP authentication configuration information (CLI)**

The `show sntp` command displays SNTP configuration information, including any SNTP authentication keys that have been configured on the switch.

### SNTP configuration information

```bash
switch(config)# show sntp

SNTP Configuration

SNTP Authentication : Enabled
Time Sync Mode: Sntp
SNTP Mode : Unicast
Poll Interval (sec) [720] : 720

<table>
<thead>
<tr>
<th>Priority</th>
<th>SNTP Server Address</th>
<th>Protocol Version</th>
<th>KeyId</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10.10.10.2</td>
<td>3</td>
<td>55</td>
</tr>
<tr>
<td>2</td>
<td>fe80::200:24ff:fec8:4ca8</td>
<td>3</td>
<td>55</td>
</tr>
</tbody>
</table>
```
Viewing all SNTP authentication keys that have been configured on the switch (CLI)

Enter the `show sntp authentication` command, as shown in Show sntp authentication command output on page 47.

Show sntp authentication command output

```
switch(config)# show sntp authentication

SNTP Authentication Information
SNTP Authentication : Enabled

Key-ID    Auth Mode  Trusted
--------  ---------  -----
55        MD5       Yes
10        MD5       No
```

Viewing statistical information for each SNTP server (CLI)

To display the statistical information for each SNTP server, enter the `show sntp statistics` command.

The number of SNTP packets that have failed authentication is displayed for each SNTP server address, as shown in SNTP authentication statistical information on page 47.

SNTP authentication statistical information

```
switch(config)# show sntp statistics

SNTP Statistics
Received Packets : 0
Sent Packets : 3
Dropped Packets : 0

SNTP Server Address                     Auth Failed Pkts
--------------------------------------- ----------------
10.10.10.1                                  0
fe80::200:24ff:fec8:4ca8                    0
```

Saving configuration files and the include-credentials command

You can use the `include-credentials` command to store security information in the running-config file. This allows you to upload the file to a TFTP server and then later download the file to the switches on which you want to use the same settings. For more information about the `include-credentials` command, see "Configuring Username and Password Security" in the access security guide for your switch.

The authentication key values are shown in the output of the `show running-config` and `show config` commands only if the `include-credentials` command was executed.

When SNTP authentication is configured and `include-credentials` has not been executed, the SNTP authentication configuration is not saved.

Configuration file with SNTP authentication information

```
switch(config) # show config
Startup configuration:
.
.
.
timesync sntp
```
sntp broadcast
sntp 50
sntp authentication
sntp server priority 1 10.10.10.2 3 key-id 55
sntp server priority 2 fe80::200:24ff:fec8:4ca8 4 key-id 55

**NOTE:** SNTP authentication has been enabled and a key-id of 55 has been created.

In this Example:, the `include-credentials` command has not been executed and is not present in the configuration file. The configuration file is subsequently saved to a TFTP server for later use. The SNTP authentication information is not saved and is not present in the retrieved configuration files, as shown in the following Example:.

### Retrieved configuration file when `include credentials` is not configured

```plaintext
switch(config) # copy tftp startup-config 10.2.3.44 config1
.
.
Switch reboots ...
.
Startup configuration
.

timesync sntp
sntp broadcast
sntp 50 sntp server priority 1 10.10.10.2 3
sntp server priority 2 fe80::200:24ff:fec8:4ca8 4
.

**NOTE:** The SNTP authentication line and the Key-ids are not displayed. You must reconfigure SNTP authentication.
If `include-credentials` is configured, the SNTP authentication configuration is saved in the configuration file. When the `show config` command is entered, all of the information that has been configured for SNTP authentication displays, including the key-values.

**Figure 2: Saved SNTP Authentication information when `include-credentials` is configured**

![Switch(config)# show config]

```
Switch(config)# show config
Startup configuration:
.
.
include-credentials
timesync sntp
snntp broadcast
snntp 50
snntp authentication
snntp authentication key-id 55 authentication-mode md5 key-value “secretkey1” trusted
snntp authentication key-id 2 authentication-mode md5 key-value “secretkey2”

snntp server priority 1 10.10.10.2 3 key-id 55
snntp server priority 2 fe80::200:24ff:fe08:4ca8 4 key-id 55
snntp server priority 3 10.10.4.60 3
.
.
```

**SNTP unicast time polling with multiple SNTP servers**

When running SNTP unicast time polling as the time synchronization method, the switch requests a time update from the server you configured with either the `Server Address` parameter in the menu interface, or the primary server in a list of up to three SNTP servers configured using the CLI. If the switch does not receive a response from the primary server after three consecutive polling intervals, the switch tries the next server (if any) in the list. If the switch tries all servers in the list without success, it sends an error message to the Event Log and reschedules to try the address list again after the configured `Poll Interval` time has expired.

If there are already three SNTP server addresses configured on the switch, and you want to use the CLI to replace one of the existing addresses with a new one, you must delete the unwanted address before you configure the new one.

**Displaying all SNTP server addresses configured on the switch (CLI)**

The System Information screen in the menu interface displays only one SNTP server address, even if the switch is configured for two or three servers. The CLI `show management` command displays all configured SNTP servers on the switch.

**How to list all SNTP servers configured on the switch**

```
switch(config)# show management
Status and Counters - Management Address Information

Time Server Address : fe80::215:60ff:fe7a:adc0%vlan10

<table>
<thead>
<tr>
<th>Priority</th>
<th>SNTP Server Address</th>
<th>Protocol Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2001:db8::215:60ff:fe79:8980</td>
<td>7</td>
</tr>
<tr>
<td>2</td>
<td>10.255.5.24</td>
<td>3</td>
</tr>
<tr>
<td>3</td>
<td>fe80::123%vlan10</td>
<td>3</td>
</tr>
</tbody>
</table>
```

Chapter 2 Time Protocols
Adding and deleting SNTP server addresses

Adding addresses

As mentioned earlier, you can configure one SNTP server address using either the Menu interface or the CLI. To configure a second and third address, you must use the CLI. To configure the remaining two addresses, you would do the following:

Creating additional SNTP server addresses with the CLI

```
switch(config)# sntp server priority <1-3> 2001:db8::215:60ff:fe79:8980
switch(config)# sntp server 10.255.5.24
```

**NOTE:** If there are already three SNTP server addresses configured on the switch, and you want to use the CLI to replace one of the existing addresses with a new one, you must delete the unwanted address before you configure the new one.

Deleting addresses

**Syntax:**

```
no sntp server <ip-addr>
```

Deletes a server address. If there are multiple addresses and you delete one of them, the switch re-orders the address priority.

**Example:**

To delete the primary address in the above Example: and automatically convert the secondary address to primary:

```
switch(config)# no sntp server 10.28.227.141
```

SNTP messages in the Event Log

If an SNTP time change of more than three seconds occurs, the switch's Event Log records the change. SNTP time changes of less than three seconds do not appear in the Event Log.

Network Time Protocol (NTP)

All NTP communications use Coordinated Universal Time (UTC). An NTP server usually receives its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server, and then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two machines to within a millisecond of each other.

NTP uses a stratum to describe the distance between a network device and an authoritative time source:

- A stratum 1 time server is directly attached to an authoritative time source (such as a radio or atomic clock or a GPS time source).
- A stratum 2 NTP server receives its time through NTP from a stratum 1 time server.
Before synchronizing, NTP compares the time reported by several network devices and does not synchronize with one that is significantly different, even if it is a stratum 1.

The security features of NTP can be used to avoid the accidental or malicious setting of incorrect time. One such mechanism is available: an encrypted authentication mechanism.

Though similar, the NTP algorithm is more complex and accurate than the Simple Network Time Protocol (SNTP).

**IMPORTANT:** Enabling this feature results in synchronizing the system clock; therefore, it may affect all sub-systems that rely on system time.

### Commands

The following commands allow the user to configure NTP or show NTP configurations.

**timesync ntp**

This command is used to update the system clock using NTP.

**Syntax**

```
 timesync ntp
```

**Description**

Update the system clock using NTP.

**ntp**

This command selects the operating mode of the NTP client.

**Syntax**

```
 ntp [broadcast|unicast]
```

**Options**

- **broadcast**
  
  Sets ntp client to operate in broadcast mode.

- **unicast**
  
  Sets ntp client to operate in unicast mode.

**Usage**

The default mode is broadcast.

**[no] ntp**

This command disables NTP and removes all NTP configurations on the device.

**Syntax**

```
 [no] ntp [authentication <key-id> | broadcast | enable | max-association <integer> | server <IP-ADDR> | trap <trap-name> | unicast]
```

**Description**
Disable NTP and removes the entire NTP configuration.

Options

authentication
  Configure NTP authentication.

broadcast
  Operate in broadcast mode.

enable
  Enable/disable NTP.

max-association
  Maximum number of Network Time Protocol (NTP) associations.

server
  Configure a NTP server to poll for time synchronization.

trap
  Enable/disable NTP traps.

unicast
  Operate in unicast mode.

Example

switch(config)# no ntp
This will delete all NTP configurations on this device. Continue [y/n]?

ntp enable
This command is used to enable or disable NTP on the switch.

Syntax

ntp enable

Example

switch(config)# ntp
enable       Enable/disable NTP.

Description
Enable or disable NTP. Use [no] to disable NTP.

Restrictions

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>If timeSync is in SNTP or Timep when NTP is enabled.</td>
<td>Timesync is not configured to NTP.</td>
</tr>
<tr>
<td>When timesync is NTP and ntp is enabled and we try to change timesync to SNTP.</td>
<td>Disable NTP before changing timesync to SNTP or TIMEP</td>
</tr>
</tbody>
</table>

ntp authentication
This command is used for authentication of NTP server by the NTP client.

Syntax
ntp authentication key-id <KEY-ID> [authentication-mode <MODE> key-value <KEY-STRING>] [trusted]

Parameters/Options
key-id <id>
Sets the key-id for the authentication key.

Subcommands
authentication-mode
Sets the NTP authentication mode

key-value <KEY-STRING>
Sets the key-value for the authentication key.
[trusted]
Sets the authentication key as trusted.

Example
Switch(config)# ntp
Authentication Configure NTP authentication.

Switch(config)# ntp authentication
key-id Set the key-id for this authentication key.

Switch(config)# ntp authentication key-id
<1-4294967295> Set the authentication key-id.

Switch(config)# ntp authentication key-id 1
authentication-mode Set the NTP authentication mode.
trusted Set this authentication key as trusted.

Switch(config)# ntp authentication key-id 1
authentication-mode|trusted md5
Authenticate using MD5.

Switch(config)# ntp authentication key-id 1
authentication-mode|trusted md5 key-value Set the NTP authentication key.

Switch(config)# ntp authentication key-id 1
authentication-mode|trusted md5 key-value KEY Enter a string to be set as the NTP authentication key.

ntp authentication key-id

Syntax
ntp authentication key-id
<key-id> [authentication-mode [md5 | sha1]
key-value <key-value>] [trusted]
Description
The NTP client authenticates the NTP server.

Options

authentication-mode
Set the NTP authentication mode.
- md5: Authenticate using MD5.
- sha1: Authenticate using SHA1.

trusted
Set this authentication key as trusted.

ntp max-association
This command is used to configure the maximum number of servers associated with this NTP client.

Syntax
ntp max-association <number>

Options

max-association <number>
Sets the maximum number of NTP associations.

Description
Configure maximum number of servers associated with the client. Up to eight servers can be configured as the maximum.

Restrictions
The range for a maximum number of NTP associations is 1–8.

Example
Switch(config)# ntp max-associations
Maximum number of NTP associations.

Switch(config)# ntp max-associations <1-8> Enter the number.

Restrictions

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>When the number of configured NTP servers is more than the max-associations value.</td>
<td>The maximum number of NTP servers allowed is &lt;number&gt;.</td>
</tr>
<tr>
<td>When the max-associations value is less than the (n) number of configured NTP servers.</td>
<td>Max-associations value cannot be less than the number of NTP servers configured.</td>
</tr>
</tbody>
</table>

ntp server
This command is used to configure the NTP servers.
Syntax

[no] ntp server

ntp server <IP-ADDR|IPv6-ADDR> [key <key-id>] [oobm] [max-poll <max-poll-val>][min-poll <min-poll-val>][burst | iburst] [version <1-4>]

Parameters/Options

[no]
Removes the unicast NTP configurations on the device.

Subcommands

IP-ADDR
Sets the IPv4 address of the NTP server.

IPV6-ADDR
Sets the IPv6 address of the NTP server.

key <key-id>
Specifies the authentication key.

max-poll <max-poll-val>
Configures the maximum time intervals in power of 2 seconds. Range is 4–17 (e.g., 5 would translate to 2 raised to 5 or 32).

min-poll <min-poll-val>
Configures the minimum time intervals in seconds. Range is 4–17.

burst
Enables burst mode.

iburst
Enables initial burst mode.

version
Sets version 1–4.

Usage

A maximum of 8 NTP servers can be configured.

Example

switch(config)# ntp
server           Allow the software clock to be synchronized by an NTP
time server.
broadcast       Operate in broadcast mode.
unicast         Operate in unicast mode.

switch(config)# ntp server
IP-ADDR          IPv4 address of the NTP server.
IPV6-ADDR        IPv6 address of the NTP server.

switch(config)# ntp server <IP-ADDR>
Key               Specify the authentication key.
switch(config)# ntp server <IP-ADDR> key key-id
Max-poll Configure the maximum time intervals in seconds.

Switch(config)# ntp server <IP-ADDR> key key-id
Min-poll Configure the minimum time intervals in seconds.

switch(config)# ntp server <IP-ADDR> key key-id max-poll
<4-17> Enter an integer number.

switch(config)# ntp server <IP-ADDR> key key-id min-poll
<4-17> Enter an integer number.

switch(config)# ntp server <IP-ADDR> key key-id prefer max-poll
<max-poll-val> min-poll <min-poll-val>
iburst Enable initial burst (iburst) mode.
burst Enable burst mode.

Switch(config)# ntp server IP-ADDR key key-id prefer maxpoll <number>
minpoll <number> iburst

Restrictions

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>If authentication key-id not configured</td>
<td>Authentication key-id has not been configured.</td>
</tr>
<tr>
<td>If Key-id is not marked as trusted</td>
<td>Key-id is not trusted.</td>
</tr>
<tr>
<td>When min poll value is more than max poll value</td>
<td>NTP max poll value should be more than min poll value.</td>
</tr>
</tbody>
</table>

ntp server key-id

Syntax

ntp server <IP-ADDR | IPV6-ADDR>
key-id <key-id> [max-poll
<max-poll-val>] [min-poll
<min-poll-val>] [burst | iburst]

Description

Configure the NTP server. <IP-ADDR> indicates the IPv4 address of the NTP server. <IPV6-ADDR> indicates the IPv6 address of the NTP server.

Options

burst

   Enables burst mode.

iburst

   Enables initial burst (iburst) mode.
key-id
   Set the authentication key to use for this server.
max-poll <max-poll-val>
   Configure the maximum time intervals in seconds.
min-poll <min-poll-val>
   Configure the minimum time intervals in seconds.

ntp ipv6-multicast
This command is used to configure NTP multicast on a VLAN interface.

Syntax
ntp ipv6-multicast

Description
Configure the interface to listen to the NTP multicast packets.

Example
Switch(vlan-2)# ntp
ipv6-multicast       Configure the interface to listen to the NTP multicast packets.

Restrictions

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>If ipv6 is not enabled on vlan interface</td>
<td>IPv6 address not configured on the VLAN.</td>
</tr>
</tbody>
</table>

debug ntp
This command is used to display debug messages for NTP.

Syntax
debug ntp <event | packet>

Options

<table>
<thead>
<tr>
<th>event</th>
<th>Displays event log messages related to NTP.</th>
</tr>
</thead>
<tbody>
<tr>
<td>packets</td>
<td>Displays NTP packet messages.</td>
</tr>
</tbody>
</table>

Description
Enable debug logging. Use [no] to disable debug logging.

Example
Switch(config)# debug ntp
event          Display event log messages related to NTP.
packet         Display NTP packet messages.

ntp trap
This command is used to configure NTP traps.
Syntax
ntp trap <trap-name>

Description
Enable NTP traps. Use [no] to disable NTP traps.

Options
ntp-mode-change
  Trap name resulting in send notification when the NTP entity changes mode, including starting and stopping (if possible).

ntp-stratum-change
  Trap name resulting in send notification when stratum level of NTP changes.

ntp-peer-change
  Trap name resulting in send notification when a (new) syspeer has been selected.

ntp-new-association
  Trap name resulting in send notification when a new association is mobilized.

ntp-remove-association
  Trap name resulting in send notification when an association is demobilized.

ntp-config-change
  Trap name resulting in send notification when the NTP configuration has changed.

ntp-leapsec-announced
  Trap name resulting in send notification when a leap second has been announced.

ntp-alive-heartbeat
  Trap name resulting in send notification periodically (as defined by ntpEntHeartbeatInterval) to indicate that the NTP entity is still alive.

all
  Enable all traps.

Usage
The traps defined below are generated as the result of finding an unusual condition while parsing an NTP packet or a processing a timer event. Note that if more than one type of unusual condition is encountered while parsing the packet or processing an event, only the first one will generate a trap. Possible trap names are:
- 'ntpEntNotifModeChange' The notification to be sent when the NTP entity changes mode, including starting and stopping (if possible).
- 'ntpEntNotifStratumChange' The notification to be sent when stratum level of NTP changes.
- 'ntpEntNotifSyspeerChanged' The notification to be sent when a (new) syspeer has been selected.
- 'ntpEntNotifAddAssociation' The notification to be sent when a new association is mobilized.
- 'ntpEntNotifRemoveAssociation' The notification to be sent when an association is demobilized.
- 'ntpEntNotifConfigChanged' The notification to be sent when the NTP configuration has changed.
- 'ntpEntNotifLeapSecondAnnounced' The notification to be sent when a leap second has been announced.
- 'ntpEntNotifHeartbeat' The notification to be sent periodically (as defined by ntpEntHeartbeatInterval) to indicate that the NTP entity is still alive.
- 'ntpEntNotifAll' The notification to be sent when all traps have been enabled

**show ntp statistics**

This command is used to show NTP statistics.

**Syntax**

```
show ntp statistics
```

**Description**

Show information about NTP packets.

**Examples**

```
Switch(config)# show ntp statistics
NTP Global statistics information
NTP In Packets : 100
NTP Out Packets : 110
NTP Bad Version Packets : 4
NTP Protocol Error Packets : 0
```

```
switch(config)# show ntp statistics
NTP Global statistics information
NTP In Packets : 100
NTP Out Packets : 110
NTP Bad Version Packets : 4
NTP Protocol Error Packets : 0
```

**show ntp status**

**Syntax**

```
show ntp status
```

**Description**

Show the status of NTP.

```
show ntp status
```

**Example**

```
Switch(config)# show ntp status
NTP Status information
NTP Status : Disabled
Synchronization Status : Synchronized
Stratum Number : 2
Reference Assoc Id : 1
Reference : 192.0.2.1
NTP Mode : Broadcast
Peer Dispersion : 8.01 sec
Leap Direction : 1
Clock Offset : 0.0000 sec
Root Delay : 0.00 sec
```

Chapter 2 Time Protocols
show ntp associations

Syntax

show ntp associations [detail <IP-ADDR>]

Description

Show the status of configured NTP associations.

Options

detail

Show the detailed status of NTP associations configured for the system.

Switch(config)# show ntp associations

## Precision Time Protocol (PTP)

### ptp

**Syntax**

```conf
ptp {enable | disable}
no ptp {enable | disable}
```

**Description**

Enable updating of IEEE 1588 PTP packets.

- The feature is disabled by default.
- The no form of this command is the same as `ptp disable`.

**NOTE:** This feature is available on the 2930M and only in standalone. It is disabled for stacks.

**Command context**

`interface`

**Parameters**

- **enable**
  - When the `ptp` command is enabled, ports that support IEEE 1588 will operate in end-to-end transparent mode and will update the correction field of forwarded PTP packets.

- **disable**
  - When the `ptp` command is disabled, PTP packets are forwarded unchanged.

**Restrictions**

- IEEE 1588 end-to-end transparent mode cannot be enabled when there are flexible modules or transceiver ports in the system that do not support IEEE 1588. If a user attempts this, an error message like the following
Port A1 does not support IEEE 1588 end-to-end transparent mode. Use the command `show ptp` to identify the unsupported ports.

- IEEE 1588 end-to-end transparent mode cannot be enabled on a stack. If the user attempts this, an error message like the following displays: IEEE 1588 end-to-end transparent mode cannot be enabled when stacking is enabled.
- IEEE 1588 end-to-end transparent mode must be enabled or disabled on all ports at the same time.
- MACsec cannot be enabled when IEEE 1588 end-to-end transparent mode is enabled.
- IEEE 1588 end-to-end transparent mode cannot be enabled when MACsec is enabled.

**show ptp**

**Syntax**

`show ptp [<port-list>]`

**Description**

Show IEEE 1588 PTP status.

**Command context**

Operator

**Parameters**

`port-list`

Specifies the ports for which to show PTP status.

**Example**

```
switch# show ptp

**Monitoring resources**

Chapter 2 Time Protocols
Displaying current resource usage

To display current resource usage in the switch, enter the following command:

**Syntax:**

```
show {<qos | access-list | policy> resources}
```

Displays the resource usage of the policy enforcement engine on the switch by software feature. For each type of resource, the amount still available and the amount used by each software feature is shown.

<table>
<thead>
<tr>
<th>show resources</th>
<th>This output allows you to view current resource usage and, if necessary, prioritize and reconfigure software features to free resources reserved for less important features.</th>
</tr>
</thead>
</table>
| qosaccess-listopenflowpolicy | Display the same command output and provide different ways to access task-specific information.  
                               | See “Viewing OpenFlow Resources” in the OpenFlow administrators guide for your switch. |

**Displaying current resource usage** shows the resource usage on a switch configured for ACLs, QoS, RADIUS-based authentication, and other features:

The "Rules Used" columns show that ACLs, VT, mirroring, and other features (For example, Management VLAN) have been configured globally or per-VLAN, because identical resource consumption is displayed for each port range in the switch. If ACLs were configured per-port, the number of rules used in each port range would be different.

<table>
<thead>
<tr>

</tbody>
</table>

2 of 16 Policy Engine management resources used.

**Key:**

ACL = Access Control Lists  
QoS = Device & Application Port Priority  
IDM = Identity Driven Management  
Other = Management VLAN, DHCP Snooping, ARP Protection, RA Guard.
Resource usage includes resources actually in use, or reserved for future use by the listed feature. Internal dedicated-purpose resources, such as port bandwidth limits or VLAN QoS priority, are not included.

**Viewing information on resource usage**

The switch allows you to view information about the current usage and availability of resources in the Policy Enforcement engine, including the following software features:

- Access control lists (ACL)
- Quality-of-service (QoS), including device and application port priority, ICMP rate-limiting, and QoS policies
- Dynamic assignment of per-port or per-user ACLs and QoS through RADIUS authentication designated as "IDM".
- Virus throttling (VT) using connection-rate filtering
- Mirroring policies, including switch configuration as an endpoint for remote intelligent mirroring
- Other features, including:
  - Management VLAN
  - DHCP snooping
  - Dynamic ARP protection
  - Jumbo IP-MTU

**Policy enforcement engine**

The policy enforcement engine is the hardware element in the switch that manages QoS, mirroring, and ACL policies, as well as other software features, using the rules that you configure. Resource usage in the policy enforcement engine is based on how these features are configured on the switch:

- Resource usage by dynamic port ACLs is determined as follows:
  Dynamic port ACLs configured by a RADIUS server for an authenticated client determine the current resource consumption for this feature on a specified slot. When a client session ends, the resources in use for that client become available for other uses.

- When the following features are configured globally or per-VLAN, resource usage is applied across all port groups or all slots with installed modules:
  - ACLs
  - QoS configurations that use the following commands:
    - QoS device priority (IP address) through the CLI using the `qos device-priority` command
    - QoS application port through the CLI using `qos tcp-port` or `qos udp-port`
    - VLAN QoS policies through the CLI using `service-policy`
  - Management VLAN configuration
  - DHCP snooping
  - Dynamic ARP protection
  - Remote mirroring endpoint configuration
• Mirror policies per VLAN through the CLI using `monitor service`
  
• Jumbo IP-MTU

• When the following features are configured per-port, resource usage is applied only to the slot or port group on which the feature is configured:

  ◦ ACLs or QoS applied per-port or per-user through RADIUS authentication
  
  ◦ ACLs applied per-port through the CLI using the `ip access-group` or `ipv6 traffic-filter` commands
  
  ◦ QoS policies applied per port through the CLI using the `service-policy` command
  
  ◦ Mirror policies applied per-port through the CLI using the `monitor all service` and `service-policy` commands
  
  ◦ ICMP rate-limiting through the CLI using the `rate-limit icmp` command

**Usage notes for show resources output**

• A 1:1 mapping of internal rules to configured policies in the switch does not necessarily exist. As a result, displaying current resource usage is the most reliable method for keeping track of available resources. Also, because some internal resources are used by multiple features, deleting a feature configuration may not increase the amount of available resources.

• Resource usage includes resources actually in use or reserved for future use by the listed features.

• "Internal dedicated-purpose resources" include the following features:

  ◦ Per-port ingress and egress rate limiting through the CLI using `rate-limit in/out`
  
  ◦ Per-port or per-VLAN priority or DSCP through the CLI using `qos priority` or `qos dscp`
  
  ◦ Per protocol priority through the CLI using `qos protocol`

• The "Available" columns display the resources available for additional feature use.

• The "IDM" column shows the resources used for RADIUS-based authentication.

• "Meters" are used when applying either ICMP rate-limiting or a QoS policy with a rate-limit class action.

**When insufficient resources are available**

The switch has ample resources for configuring features and supporting RADIUS-authenticated clients (with or without the optional IDM application).

If the resources supporting these features become fully subscribed:

• The current feature configuration, RADIUS-authenticated client sessions, and VT instances continue to operate normally.

• The switch generates an event log notice to say that current resources are fully subscribed.

• Currently engaged resources must be released before any of the following actions are supported:

  ◦ Modifying currently configured ACLs, IDM, VT, and other software features, such as Management VLAN, DHCP snooping, and dynamic ARP protection. You can modify currently configured classifier-base QoS and
mirroring policies if a policy has not been applied to an interface. However, sufficient resources must be available when you apply a configured policy to an interface.

- Acceptance of new RADIUS-based client authentication requests (displayed as a new resource entry for IDM). Failure to authenticate a client that presents valid credentials may indicate that insufficient resources are available for the features configured for the client in the RADIUS server. To troubleshoot, check the event log.

- Throttling or blocking of newly detected clients with high rate-of-connection requests (as defined by the current VT configuration). The switch continues to generate Event Log notifications (and SNMP trap notification, if configured) for new instances of high-connection-rate behavior detected by the VT feature.
Viewing port status and configuring port parameters

Connecting transceivers to fixed-configuration devices

If the switch either fails to show a link between an installed transceiver and another device or demonstrates errors or other unexpected behavior on the link, check the port configuration on both devices for a speed and/or duplex (mode) mismatch.

- To check the mode setting for a port on the switch, use either the Port Status screen in the menu interface or `show interfaces brief` in the CLI (see Viewing port status and configuration (CLI)).
- To display information about the transceivers installed on a switch, enter the `show tech receivers` command in the CLI (The `show tech transceivers` command on page 77).

Table 3: Status and parameters for each port type

<table>
<thead>
<tr>
<th>Status or parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Yes (default): The port is ready for a network connection. No: The port will not operate, even if properly connected in a network. Use this setting, for example, if the port needs to be shut down for diagnostic purposes or while you are making topology changes.</td>
</tr>
<tr>
<td>Status (read-only)</td>
<td>Up: The port senses a link beat. Down: The port is not enabled, has no cables connected, or is experiencing a network error. For troubleshooting information, see the installation and getting started guide you received with the switch. See also to Appendix C, &quot;Troubleshooting&quot; (in this manual).</td>
</tr>
</tbody>
</table>

Table Continued
<table>
<thead>
<tr>
<th>Status or parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>The port's speed and duplex (data transfer operation) setting. 10/100/1000Base-T</td>
</tr>
</tbody>
</table>

**Ports:**

- **Auto-MDIX (default):** Senses speed and negotiates with the port at the other end of the link for port operation (MDI-X or MDI). To see what the switch negotiates for the auto setting, use the CLI `show interfaces brief` command.

- **MDI:** Sets the port to connect with a PC using a crossover cable (manual mode—applies only to copper port switches using twisted-pair copper Ethernet cables).

- **MDIX:** Sets the port to connect with a PC using a straight-through cable (manual mode—applies only to copper port switches using twisted-pair copper Ethernet cables).

- **Auto-10:** Allows the port to negotiate between half-duplex (HDx) and full-duplex (FDx) while keeping speed at 10 Mbps. Also negotiates flow control (enabled or disabled). Hewlett Packard Enterprise recommends auto-10 for links between 10/100 auto-sensing ports connected with Cat 3 cabling. (Cat 5 cabling is required for 100 Mbps links.).

- **10HDx:** 10 Mbps, half-duplex

- **10FDx:** 10 Mbps, full-duplex

- **Auto-100:** Uses 100 Mbps and negotiates with the port at the other end of the link for other port operation features.

- **Auto-10-100:** Allows the port to establish a link with the port at the other end at either 10 Mbps or 100 Mbps, using the highest mutual speed and duplex mode available. Only these speeds are allowed with this setting.

- **Auto-1000:** Uses 1000 Mbps and negotiates with the port at the other end of the link for other port operation features.

- **100HDx:** Uses 100 Mbps, half-duplex.

- **100FDx:** Uses 100 Mbps, full-duplex

**Gigabit Fiber-Optic Ports (Gigabit-SX, Gigabit-LX, and Gigabit-LH):**

- **1000FDx:** 1000 Mbps (1 Gbps), full-duplex only

- **Auto (default):** The port operates at 1000FDx and auto-negotiates flow control with the device connected to the port.

**Gigabit Copper Ports:**

- **1000FDx:** 1000 Mbps (1 Gbps), full-duplex only

- **Auto (default):** The port operates at 1000FDx and auto-negotiates flow control with the device connected to the port.

<table>
<thead>
<tr>
<th>Status or parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>10-Gigabit CX4 Copper Ports: 10-Gigabit SC Fiber-Optic Ports (10-GbE SR, 10-GbE LR, 10-GbE ER):</strong></td>
<td>Auto: The port operates at 10 gigabits FDx and negotiates flow control. Lower speed settings or half-duplex are not allowed.</td>
</tr>
<tr>
<td><strong>Auto-MDIX</strong></td>
<td>The switch supports Auto-MDIX on 10Mb, 100Mb, and 1 Gb T/TX (copper) ports. (Fiber ports and 10-gigabit ports do not use this feature.)</td>
</tr>
<tr>
<td>• Automation: Configures the port for automatic detection of the cable type (straight-through or crossover).</td>
<td></td>
</tr>
<tr>
<td>• MDI: Configures the port to connect to a switch, hub, or other MDI-X device with a straight-through cable.</td>
<td></td>
</tr>
<tr>
<td>• MDIX: Configures the port to connect to a PC or other MDI device with a straight-through cable.</td>
<td></td>
</tr>
<tr>
<td><strong>Flow control</strong></td>
<td>• Disabled (default): The port does not generate flow control packets, and drops any flow control packets it receives.</td>
</tr>
<tr>
<td></td>
<td>• Enabled: The port uses 802.3x link layer flow control, generates flow-control packets, and processes received flow-control packets.</td>
</tr>
<tr>
<td></td>
<td>With the port mode set to Auto (the default) and flow control enabled, the switch negotiates flow control on the indicated port. If the port mode is not set to Auto, or if flow control is disabled on the port, flow control is not used. Note that flow control must be enabled on both ends of a link.</td>
</tr>
<tr>
<td><strong>Broadcast limit</strong></td>
<td>Specifies the percentage of the theoretical maximum network bandwidth that can be used for broadcast traffic. Any broadcast traffic exceeding that limit will be dropped. Zero (0) means the feature is disabled.</td>
</tr>
<tr>
<td></td>
<td>The broadcast-limit command operates at the port context level to set the broadcast limit for a port on the switch.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> This feature is not appropriate for networks that require high levels of IPX or RIP broadcast traffic.</td>
</tr>
</tbody>
</table>

**Viewing port status and configuration (CLI)**

Use the following commands to display port status and configuration data.

**Syntax:**

```
show interfaces [brief | config | < port-list >]
```
brief
Lists the current operating status for all ports on the switch.

config
Lists a subset of configuration data for all ports on the switch; that is, for each port, the display shows whether the port is enabled, the operating mode, and whether it is configured for flow control.

<port-list>
Shows a summary of network traffic handled by the specified ports.

Dynamically updating the show interfaces command (CLI/Menu)

Syntax:

show interfaces display

Uses the display option to initiate the dynamic update of the show interfaces command, with the output being the same as the show interfaces command.

NOTE: Select Back to exit the display.

Example:

switch# show interfaces display
When using the **display** option in the CLI, the information stays on the screen and is updated every 3 seconds, as occurs with the display using the menu feature. The update is terminated with **Ctrl-C**.

You can use the arrow keys to scroll through the screen when the output does not fit in one screen.

**Figure 3:** *show interfaces display command with dynamically updating output*

You can create `show` commands displaying the information that you want to see in any order you want by using the **custom** option.

**Syntax:**

```
show interfaces custom [port-list] column-list
```

Select the information that you want to display. Supported columns are shown in the table below.

**Table 4: Supported columns, what they display, and examples:**

</tbody>
</table>

You can specify the column width by entering a colon after the column name, then indicating the number of characters to display. In the above example, the Name column displays only the first four characters of the name. All remaining characters are truncated.

**NOTE:** Each field has a fixed minimum width to be displayed. If you specify a field width smaller than the minimum width, the information is displayed at the minimum width. For example, if the minimum width for the Name field is 4 characters and you specify Name:2, the Name field displays 4 characters.

You can enter parameters in any order. There is a limit of 80 characters per line; if you exceed this limit an error displays.

### Error messages associated with the show interfaces command

The following table provides information on error messages associated with the `show interfaces custom` command.

<table>
<thead>
<tr>
<th>Error</th>
<th>Error message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requesting too many fields (total characters exceeds 80)</td>
<td>Total length of selected data exceeds one line</td>
</tr>
<tr>
<td>Field name is misspelled</td>
<td>Invalid input: <code>&lt;input&gt;</code></td>
</tr>
<tr>
<td>Mistake in specifying the port list</td>
<td>Module not present for port or invalid port: <code>&lt;input&gt;</code></td>
</tr>
<tr>
<td>The port list is not specified</td>
<td>Incomplete input: custom</td>
</tr>
</tbody>
</table>

---

Chapter 3 Port Status and Configuration
Note on using pattern matching with the `show interfaces custom` command

If you have included a pattern matching command to search for a field in the output of the `show int custom` command, and the `show int custom` command produces an error, the error message may not be visible and the output is empty. For example, if you enter a command that produces an error (such as `vlan` is misspelled) with the pattern matching `include` option, the output may be empty:

```
Switch(config)# show int custom 1-3 name vlun  | include vlan1
```

It is advisable to try the `show int custom` command first to ensure there is output, and then enter the command again with the pattern matching option.

Note that in the above command, you can substitute `int` for `interface`; that is: `show int custom`.

**show interface smartrate**

**Syntax**

```
show interface <PORT-LIST> smartrate
```

**Description**

The option `smartrate` has been added to the `show interface <PORT-LIST>` command. This option is used to display port diagnostics on a Smart Rate port only. If the command is run on a non-Smart Rate port, a message similar to `Port A1: This command is only applicable to Smart Rate ports` is displayed.

The `show interface <PORT-LIST> smartrate` command can be used to retrieve the physical layer link diagnostics information for the smartrate ports. As part of 802.3bz implementation, the CLI information has been updated with the latest BASE-T modes.

**Viewing port utilization statistics (CLI)**

Use the `show interface port-utilization` command to view a real-time rate display for all ports on the switch. The example below shows a sample output from this command.

```
switch(config)# show interfaces port-utilization
Status and Counters - Port Utilization

</table>
```
Operating notes for viewing port utilization statistics

- For each port on the switch, the command provides a real-time display of the rate at which data is received (Rx) and transmitted (Tx) in terms of kilobits per second (KBits/s), number of packets per second (Pkts/s), and utilization (Util) expressed as a percentage of the total bandwidth available.

- The `show interfaces <port-list>` command can be used to display the current link status and the port rate average over a 5 minute period. Port rates are shown in bits per second (bps) for ports up to 1 Gigabit; for 10 Gigabit ports, port rates are shown in kilobits per second (Kbps).

Viewing transceiver status (CLI)

The `show interfaces transceivers` command allows you to:

- Remotely identify transceiver type and revision number without having to physically remove an installed transceiver from its slot.
- Display real-time status information about all installed transceivers, including non-operational transceivers.

The example shows sample output from the `show tech transceivers` command.

NOTE: Part # column below enables you to determine the manufacturer for a specified transceiver and revision number.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

The following transceivers may not function correctly:

<table>
<thead>
<tr>
<th>Port</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>23</td>
<td>Self test failure</td>
</tr>
</tbody>
</table>

Operating Notes

The following information is displayed for each installed transceiver:

- Port number on which transceiver is installed.
- Type of transceiver.
- Product number — Includes revision letter, such as A, B, or C. If no revision letter follows a product number, this means that no revision is available for the transceiver.
- Part number — Allows you to determine the manufacturer for a specified transceiver and revision number.
For a non-Aruba switches installed transceiver (see line 23 of "The show tech transceivers command" example), no transceiver type, product number, or part information is displayed. In the Serial Number field, non-operational is displayed instead of a serial number.

The following error messages may be displayed for a non-operational transceiver:

- Unsupported Transceiver. (SelfTest Err#060)
- This switch only supports revision B and above transceivers.
- Self test failure.
- Transceiver type not supported in this port.
- Transceiver type not supported in this software version.
- Not an Switch Transceiver.

Enabling or disabling ports and configuring port mode (CLI)

You can configure one or more of the following port parameters. See Status and parameters for each port type.

Syntax:

\[\text{[no]} \text{ interface <port-list> [<disable|enable>]}\]

Disables or enables the port for network traffic. Does not use the \text{no} form of the command. (Default: \text{enable}.)

\text{speed-duplex \text{[<auto-10|10-full|10-half|100-full|100-half|auto|auto-100|1000-full>]}\]

Note that in the above Syntax:, you can substitute \text{int} for \text{interface} (for example, int \text{<port-list>}).

Specifies the port's data transfer speed and mode. Does not use the \text{no} form of the command. (Default: \text{auto}.)

The 10/100 auto-negotiation feature allows a port to establish a link with a port at the other end at either 10 Mbps or 100 Mbps, using the highest mutual speed and duplex mode available. Only these speeds are allowed with this setting.

Examples:

To configure port C5 for auto-10-100, enter this command:

\text{switch(config)# int c5 speed-duplex auto-10-100}

To configure ports C1 through C3 and port C6 for 100Mbps full-duplex, enter these commands:

\text{switch(config)# int cl-c3,c6 speed-duplex 100-full}

Similarly, to configure a single port with the above command settings, you could either enter the same command with only the one port identified or go to the context level for that port and then enter the command. For example, to enter the context level for port C6 and then configure that port for 100FDx:

\text{switch(config)# int e c6}

\text{switch(eth-C6)# speed-duplex 100-full}
If port C8 was disabled, and you wanted to enable it and configure it for 100FDx with flow-control active, you could do so with either of the following command sets:

**Figure 4: Two methods for changing a port configuration**

```
Switch(config)# int C8 enable
Switch(config)# int C8 speed-duplex 100-full
Switch(config)# int C8 flow-control

Switch(config)# int C8
Switch(eth-C8)# enable
Switch(eth-C8)# speed-duplex 100-full
```

For more on flow control, see **Enabling or disabling flow control (CLI)** on page 79.

### Enabling or disabling flow control (CLI)

**NOTE:** You must enable flow control on both ports in a given link. Otherwise, flow control does not operate on the link and appears as **Off** in the `show interfaces brief` port listing, even if flow control is configured as enabled on the port in the switch. (See **The show interfaces brief command listing** example.) Also, the port (speed-duplex) mode must be set to **Auto** (the default).

To disable flow control on some ports, while leaving it enabled on other ports, just disable it on the individual ports you want to exclude.

(You can find more information on flow control in the **Status and parameters for each port type** table.)

**Syntax:**

```
[no] interface <port-list> flow-control
```

Enables or disables flow control packets on the port. The **no** form of the command disables flow control on the individual ports. (Default: Disabled.)

**Examples:**

Suppose that:

2. Later, you decide to disable flow control on ports A5 and A6.
3. As a final step, you want to disable flow control on all ports.
Assuming that flow control is currently disabled on the switch, you would use these commands:

**Figure 5: Configuring flow control for a series of ports**

```plaintext
switch(config)# int a1-a6 flow-control

switch(config)# show interfaces brief

```
Port shutdown with broadcast storm

A LAN broadcast storm arises when an excessively high rate of broadcast packets flood the LAN. Occurrence of LAN broadcast storm disrupts traffic and degrades network performance. To prevent LAN traffic from being disrupted, an enhancement of fault-finder commands adds new options, and the corresponding MIBs, that trigger a port disablement when a broadcast storm is detected on that port.

Under this enhancement, the CLI commands given only supports broadcast traffic and not multicast and unicast types of traffic.

The waiting period range for re-enabling ports is 0 to 604800 seconds. The default waiting period to re-enable a port is zero which prevents the port from automatic re-enabling.

**NOTE:** Avoid port flapping when choosing the waiting period by considering the time to re-enable carefully.

Use the following commands to configure the broadcast-storm on a port.

**Syntax:**

```
[no] fault-finder broadcast-storm [ethernet] <port-list> action [warn|warn-and-disable <seconds>] [percent <percent>|pps <rate>]
```

To remove the current configuration of broadcast-storm on a port, use:

**Syntax:**

```
no fault-finder broadcast-storm [ethernet] <port-list>
```

- **broadcast-storm**
  - Configure broadcast storm control.
- **pps**
  - Rising threshold level in number of broadcast packets per second.
- **percent**
  - Rising threshold level as a percentage of bandwidth of the port. The percentage is calculated on 64 byte packet size.
- **warn**
  - Log the event only.
- **warn-and-disable**
  - Log the event and disable the port.
- **seconds**
  - Re-enable the port after waiting for the specified number of seconds. Default is not to re-enable.

**Configuration examples:**

```
switch(config)# fault-finder broadcast-storm [ethernet] <A1> action [warn-and-disable <65535>] [percent <10>|pps <100>]
switch(config)# fault-finder broadcast-storm [ethernet] <A2> action [warn-and-disable <65535>] [percent <10>|pps <100>]
switch(config)# fault-finder broadcast-storm [ethernet] <A22> action [warn] [pps <100>]
```

**Viewing broadcast storm**

Use the following command to display the broadcast-storm-control configuration.
Syntax:

```
show fault-finder broadcast-storm [[ethernet] port-list]
```

Examples:

```
switch# show fault-finder broadcast-storm [A1]
```

<table>

Multicast Storm Control

Overview

A multicast storm arises when excessive multicast traffic is exchanged on network ports. Excessive traffic includes more than expected traffic, or which exceeds a limit value or some percentage of network traffic, or a percentage of network channel capacity.

To prevent this, a warning message, along with port-shutdown option, is displayed to the user when the network detects similar multicast packets. At this time, the user can disable the port temporarily and enable it again, or permanently disable it.
**fault-finder multicast-storm**

**Syntax**

```plaintext
fault-finder multicast-storm <PORT-LIST> action {warn | warn-and-disable <Seconds>} {percent <Percent> | pps <Rate>}
no fault-finder multicast-storm <PORT-LIST> action {warn | warn-and-disable <Seconds>} {percent <Percent> | pps <Rate>}
```

**Description**

Per-port command to configure multicast-storm. The `no` form of the command disables multicast-storm configuration on the port.

**Parameters**

**PORT-LIST**

Enable multicast storm control on a list of ports

**Seconds**

Configure the number of seconds for which the port remains disabled

**Percent**

Rising threshold level as a percentage of bandwidth of the port. The percentage is calculated on 64 byte packet size.

**Rate**

Rising threshold level in number of multicast packets per second

**Command context**

`config`

**Examples**

```plaintext
switch(config)# fault-finder multicast-storm
action Configure the action taken when a fault is detected.
[ethernet] PORT-LIST The ports on which to enable Multicast Storm Control.
sensitivity Configure the fault sensitivity level.

switch(config)# fault-finder multicast-storm ethernet
PORT-LIST Enter a port number, a list of ports or 'all' for all ports.

switch(config)# fault-finder multicast-storm ethernet 1/1
action Configure the action taken when a multicast storm is detected.

switch(config)# fault-finder multicast-storm ethernet 1/1 action
warn Log an event only.
warn-and-disable Log an event and disable the port.

switch(config)# fault-finder multicast-storm ethernet 1/1 action warn-and-disable
SECONDS Configure the number of seconds for which the port remains disabled. A value of 0 means that the port will remain disabled until manually re-enabled.

switch(config)# fault-finder multicast-storm ethernet 1/1 action warn-and-disable 10
percent Configure the number of inbound multicast packets per second that is considered a multicast storm. This threshold is computed assuming a size of 64 bytes per incoming multicast packet.

switch(config)# fault-finder multicast-storm ethernet 1/1 action warn-and-disable 10
pps Configure the number of inbound multicast packets per second that is considered a multicast storm.
```

Chapter 3 Port Status and Configuration
Configure ports 1/1 to 1/5 for multicast storm control, and warn and disable the ports after 100 seconds, with a rising threshold of 20%:

switch(config)# fault-finder multicast-storm ethernet 1/1-1/5 action warn-and-disable 100 percent 20

switch(config)# show fault-finder multicast-storm ethernet 1/1-1/5

Configure ports 1/1 to 1/5 for multicast storm control, and warn and disable the ports after 100 seconds, with a rising threshold of 20%:

switch(config)# fault-finder multicast-storm ethernet 1/1-1/5 action warn-and-disable 100 percent 20

switch(config)# show fault-finder multicast-storm ethernet 1/1-1/5

Disable multicast storm control on port 1/1:

switch(config)# no fault-finder multicast-storm ethernet 1/1

switch(config)# show fault-finder multicast-storm ethernet 1/1

Per port show fault-finder output:

switch(config)# show fault-finder multicast-storm 1/1

Configure ports 1/1 to 1/5 for multicast storm control, and warn and disable the ports after 100 seconds, with a rising threshold of 20%:

switch(config)# fault-finder multicast-storm ethernet 1/1-1/5 action warn-and-disable 100 percent 20

switch(config)# show fault-finder multicast-storm ethernet 1/1-1/5

Disable multicast storm control on port 1/1:

switch(config)# no fault-finder multicast-storm ethernet 1/1

switch(config)# show fault-finder multicast-storm ethernet 1/1

Configure ports 1/1 to 1/5 for multicast storm control, and warn and disable the ports after 100 seconds, with a rising threshold of 20%:

switch(config)# fault-finder multicast-storm ethernet 1/1-1/5 action warn-and-disable 100 percent 20

switch(config)# show fault-finder multicast-storm ethernet 1/1-1/5

Disable multicast storm control on port 1/1:

switch(config)# no fault-finder multicast-storm ethernet 1/1

switch(config)# show fault-finder multicast-storm ethernet 1/1

Configure ports 1/1 to 1/5 for multicast storm control, and warn and disable the ports after 100 seconds, with a rising threshold of 20%:

switch(config)# fault-finder multicast-storm ethernet 1/1-1/5 action warn-and-disable 100 percent 20

switch(config)# show fault-finder multicast-storm ethernet 1/1-1/5

Disable multicast storm control on port 1/1:

switch(config)# no fault-finder multicast-storm ethernet 1/1

switch(config)# show fault-finder multicast-storm ethernet 1/1
fault-finder multicast-storm action

Syntax
fault-finder multicast-storm [action {warn | warn-and-disable}] [sensitivity {low | medium | high}]
no fault-finder multicast-storm [action {warn | warn-and-disable}] [sensitivity {low | medium | high}]

Description
Global command to configure multicast-storm. The no form of the command disables multicast-storm configuration on the port. The default sensitivity is medium and the default action is warn.

Parameters
warn
  Log an event only
warn-and-disable
  Log an event and disable the port
low
  Low sensitivity
medium
  Medium sensitivity
high
  High sensitivity

Command context
cfg

Examples
switch(config)# fault-finder multicast-storm action warn sensitivity
Configure the fault sensitivity level.

switch(config)# fault-finder multicast-storm action warn sensitivity low medium high
Low sensitivity.
Medium sensitivity.
High sensitivity.

switch(config)# fault-finder multicast-storm action warn-and-disable sensitivity
Configure the fault sensitivity level.

switch(config)# fault-finder multicast-storm action warn-and-disable sensitivity low medium high
Low sensitivity.
Medium sensitivity.
High sensitivity.

switch(config)# fault-finder multicast-storm action warn-and-disable sensitivity high
Global show command for auto-100 duplex Smart Rate port:

switch(config)# show fault-finder
Fault Finder
Fault ID   Sensitivity   Action
----------------- --------------

show running-config

Syntax
show running-config

Description
Displays information about the current configuration.

Command context
Manager

Example

switch(config)# show running-config

Running configuration:

; hpStack_WC Configuration Editor; Created on release #WC.16.06.0000x

show logging

Syntax
show logging

**Description**
Checks the FFI multicast-storm logging message.

**Command context**
Manager

**Example**
```
switch# show logging
```

<table>
<thead>
<tr>
<th>Keys:</th>
<th>W=Warning</th>
<th>I=Information</th>
<th>M=Major</th>
<th>D=Debug</th>
<th>E=Error</th>
</tr>
</thead>
</table>

---- Event Log listing: Events Since Boot ----
I 01/07/90 20:22:55 00076 ports: port 3 is now on-line
M 01/07/90 20:22:52 02677 FFI: port 3-Port enabled by Fault-finder.
I 01/07/90 20:22:33 00077 ports: port 3 is now off-line
M 01/07/90 20:22:33 02676 FFI: port 3-Re-enable after 20 seconds.
M 01/07/90 20:22:33 02673 FFI: port 3-Port disabled by Fault-finder.
M 01/07/90 20:22:33 02675 FFI: port 3-Excessive Multicast-storm control threshold 10 % exceeded.

**Restrictions**
Multicast storm control is not supported in the following scenarios:

- Unicast packet traffic
- If the port is configured as a VSF port
- If the port is configured as a trunk port

**Configuring auto-MDIX**
Copper ports on the switch can automatically detect the type of cable configuration (MDI or MDI-X) on a connected device and adjust to operate appropriately.

This means you can use a "straight-through" twisted-pair cable or a "crossover" twisted-pair cable for any of the connections—the port makes the necessary adjustments to accommodate either one for correct operation. The following port types on your switch support the IEEE 802.3ab standard, which includes the "Auto MDI/MDI-X" feature:

- 10/100-TX xl module ports
- 100/1000-T xl module ports
- 10/100/1000-T xl module ports

Using the above ports:

- If you connect a copper port using a straight-through cable on a switch to a port on another switch or hub that uses MDI-X ports, the switch port automatically operates as an MDI port.
- If you connect a copper port using a straight-through cable on a switch to a port on an end node—such as a server or PC—that uses MDI ports, the switch port automatically operates as an MDI-X port.

Auto-MDIX was developed for auto-negotiating devices, and was shared with the IEEE for the development of the IEEE 802.3ab standard. Auto-MDIX and the IEEE 802.3ab Auto MDI/MDI-X feature are completely compatible. Additionally, Auto-MDIX supports operation in forced speed and duplex modes.

For more information on this subject, see the IEEE 802.3ab standard reference. For more information on MDI-X, the installation and getting started guide for your switch.

---

Chapter 3 Port Status and Configuration
**Manual override**

If you require control over the MDI/MDI-X feature, you can set the switch to either of these non-default modes:

- Manual MDI
- Manual MDI-X

The table below shows the cabling requirements for the MDI/MDI-X settings.

**Table 5: Cable types for auto and manual MDI/MDI-X settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>MDI/MDI-X device type</th>
<th>Switch, hub, or other MDI-X device</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual MDI</td>
<td>Crossover cable</td>
<td>Straight-through cable</td>
</tr>
<tr>
<td>Manual MDI-X</td>
<td>Straight-through cable</td>
<td>Crossover cable</td>
</tr>
<tr>
<td>Auto-MDI-X (the default)</td>
<td>Either crossover or straight-through cable</td>
<td></td>
</tr>
</tbody>
</table>

The AutoMDIX features apply only to copper port switches using twisted-pair copper Ethernet cables.

**Configuring auto-MDIX (CLI)**

The auto-MDIX features apply only to copper port switches using twisted-pair copper Ethernet cables. For information about auto-MDIX, see Configuring auto-MDIX on page 89.

**Syntax:**

```
interface <port-list> mdix-mode < {auto-mdix | mdi | mdix}>
```

<table>
<thead>
<tr>
<th>mdix</th>
<th>The manual mode setting that configures the port for connecting to either a switch, hub, or other MDI-X device with a crossover cable, or to a PC or other MDI device with a straight-through cable.</th>
</tr>
</thead>
<tbody>
<tr>
<td>mdi</td>
<td>The manual mode setting that configures the port for connecting to either a PC or other MDI device with a crossover cable, or to a switch, hub, or other MDI-X device with a straight-through cable.</td>
</tr>
</tbody>
</table>

**Syntax:**

```
show interfaces config
```

Lists the current per-port Auto/MDI/MDI-X configuration.

**Syntax:**

```
show interfaces brief
```
• Where a port is linked to another device, this command lists the MDI mode the port is currently using.

• In the case of ports configured for `auto-mdix`, the MDI mode appears as either MDI or MDIX, depending upon which option the port has negotiated with the device on the other end of the link.

• In the case of ports configured for MDI or MDIX, the mode listed in this display matches the configured setting.

• If the link to another device was up, but has gone down, this command shows the last operating MDI mode the port was using.

• If a port on a given switch has not detected a link to another device since the last reboot, this command lists the MDI mode to which the port is currently configured.

The `show interfaces config` displays the following data when port A1 is configured for `auto-mdix`, port A2 is configured for `mdi`, and port A3 is configured for `mdix`:

### Displaying the current MDI configuration

```
switch(config)# show interfaces config
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Enabled</th>
<th>Mode</th>

</tr>
</tbody>
</table>

### Using friendly (optional) port names

This feature enables you to assign alphanumeric port names of your choosing to augment automatically assigned numeric port names. This means you can configure meaningful port names to make it easier to identify the source of information listed by some `show` commands. (Note that this feature augments port numbering, but does not replace it.)
Configuring and operating rules for friendly port names

- At either the global or context configuration level, you can assign a unique name to a port. You can also assign the same name to multiple ports.
- The friendly port names you configure appear in the output of the `show name [port-list]`, `show config`, and `show interface <port-number >` commands. They do not appear in the output of other `show` commands or in Menu interface screens. (See Displaying friendly port names with other port data (CLI) on page 93.)
- Friendly port names are not a substitute for port numbers in CLI commands or Menu displays.
- Trunking ports together does not affect friendly naming for the individual ports. (If you want the same name for all ports in a trunk, you must individually assign the name to each port.)
- A friendly port name can have up to 64 contiguous alphanumeric characters.
- Blank spaces within friendly port names are not allowed, and if used, cause an invalid input error. (The switch interprets a blank space as a name terminator.)
- In a port listing, not assigned indicates that the port does not have a name assignment other than its fixed port number.
- To retain friendly port names across reboots, you must save the current running-configuration to the startup-config file after entering the friendly port names. (In the CLI, use the `write memory` command.)

Configuring friendly port names (CLI)

For detailed information about friendly port names, see Using friendly (optional) port names on page 91.

**Syntax:**

```
interface <port-list> name <port-name-string>
```

Assigns a port name to port-list.

**Syntax:**

```
no interface <port-list> name
```

Deletes the port name from <port-list>.

Configuring a single port name (CLI)

Suppose that you have connected port A3 on the switch to Bill Smith's workstation, and want to assign Bill's name and workstation IP address (10.25.101.73) as a port name for port A3:

```
switch(config)# int A3 name Bill_Smith@10.25.101.73
switch(config)# write mem
switch(config)# show name A3
```

### Port Names

- **Port**: A3
- **Type**: 10/100TX
Configuring the same name for multiple ports (CLI)

Suppose that you want to use ports A5 through A8 as a trunked link to a server used by a drafting group. In this case you might configure ports A5 through A8 with the name "Draft-Server:Trunk."

### Configuring one friendly port name on multiple ports

```bash
switch(config)# int a5-a8 name Draft-Server:Trunk
switch(config)# write mem
switch(config)# show name a5-a8
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>A5</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
<tr>
<td>A6</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
<tr>
<td>A7</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
<tr>
<td>A8</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
</tbody>
</table>

### Displaying friendly port names with other port data (CLI)

You can display friendly port name data in the following combinations:

**Syntax:**

- `show name`
  - Displays a listing of port numbers with their corresponding friendly port names and also quickly shows you which ports do not have friendly name assignments. (*show name data comes from the running-config file.*)

**Syntax:**

- `show interface <port-number>`
  - Displays the friendly port name, if any, along with the traffic statistics for that port. (The friendly port name data comes from the running-config file.)

**Syntax:**

- `show config`
  - Includes friendly port names in the per-port data of the resulting configuration listing. (*show config data comes from the startup-config file.*)

**Listing all ports or selected ports with their friendly port names (CLI)**

**Syntax:**

- `show name [port-list]`
Lists the friendly port name with its corresponding port number and port type. The `show name` command without a port list shows this data for all ports on the switch.

### Friendly port name data for all ports on the switch

```plaintext
switch(config)# show name
Port Names
<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>10GbE-T</td>
<td></td>
</tr>
<tr>
<td>A2</td>
<td>10GbE-T</td>
<td></td>
</tr>
<tr>
<td>A3</td>
<td>10GbE-T</td>
<td>Bill_Smith@10.25.101.73</td>
</tr>
<tr>
<td>A4</td>
<td>10GbE-T</td>
<td></td>
</tr>
<tr>
<td>A5</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
<tr>
<td>A6</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
<tr>
<td>A7</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
<tr>
<td>A8</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
</tbody>
</table>
```

### Friendly port name data for specific ports on the switch

```plaintext
switch(config)# show name A3-A5
Port Names
<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>A3</td>
<td>10GbE-T</td>
<td>Bill_Smith@10.25.101.73</td>
</tr>
<tr>
<td>A4</td>
<td>10GbE-T</td>
<td></td>
</tr>
<tr>
<td>A5</td>
<td>10GbE-T</td>
<td>Draft-Server:Trunk</td>
</tr>
</tbody>
</table>
```

### Including friendly port names in per-port statistics listings (CLI)

**Syntax:**

```plaintext
show interface <port-number>
```

Includes the friendly port name with the port's traffic statistics listing. A friendly port name configured to a port is automatically included when you display the port's statistics output.

If you configure port A1 with the name "O'Connor_10.25.101.43," the `show interface` output for this port appears similar to the following:

### A friendly port name in a per-port statistics listing

```plaintext
switch(config)# show interface a1
Status and Counters - Port Counters for port A1
<table>
<thead>
<tr>
<th>Name</th>
<th>O’Connor@10.25.101.43</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>001871-b995ff</td>
</tr>
<tr>
<td>Link Status</td>
<td>Up</td>
</tr>
<tr>
<td>Totals (Since boot or last clear) :</td>
<td></td>
</tr>
<tr>
<td>Bytes Rx</td>
<td>2,763,197</td>
</tr>
<tr>
<td>Unicast Rx</td>
<td>2044</td>
</tr>
<tr>
<td>Bcast/Mcast Rx</td>
<td>23,456</td>
</tr>
<tr>
<td>Errors (Since boot or last clear) :</td>
<td></td>
</tr>
<tr>
<td>FCS Rx</td>
<td>0</td>
</tr>
<tr>
<td>Alignment Rx</td>
<td>0</td>
</tr>
<tr>
<td>Runts Rx</td>
<td>0</td>
</tr>
<tr>
<td>Bytes Tx</td>
<td>22,972</td>
</tr>
<tr>
<td>Unicast Tx</td>
<td>128</td>
</tr>
<tr>
<td>Bcast/Mcast Tx</td>
<td>26</td>
</tr>
<tr>
<td>Drops Tx</td>
<td>0</td>
</tr>
<tr>
<td>Collisions Tx</td>
<td>0</td>
</tr>
<tr>
<td>Late Colln Tx</td>
<td>0</td>
</tr>
</tbody>
</table>
```
For a given port, if a friendly port name does not exist in the running-config file, the Name line in the above command output appears as:

Name :

**Searching the configuration for ports with friendly port names (CLI)**

This option tells you which friendly port names have been saved to the startup-config file. *(show config does not include ports that have only default settings in the startup-config file.)*

**Syntax:**

```
show config
```

Includes friendly port names in a listing of all interfaces (ports) configured with non-default settings. Excludes ports that have neither a friendly port name nor any other non-default configuration settings.

See **Listing of the startup-config file with a friendly port name configured (and saved)** on page 95 to configure port A1 with a friendly port name. Notice that the command sequence saves the friendly port name for port A1 in the startup-config file. The name entered for port A2 is not saved because it was executed after `write memory`.

**Listing of the startup-config file with a friendly port name configured (and saved)**

```
switch(config)# int A1 name Print_Server@10.25.101.43
switch(config)# write mem
switch(config)# int A2 name Herbert's_PC
switch(config)# show config
```

```
Startup configuration:
; J9091A Configuration Editor; Created on release xx.15.05.xxxx
hostname "Switch"
    interface AQ
    name "Print_Server@10.25.101.43"
exit
snmp-server community "public" Unrestricted
```

Chapter 3 Port Status and Configuration
Uni-directional link detection (UDLD)

Uni-directional link detection (UDLD) monitors a link between two switches and blocks the ports on both ends of the link if the link fails at any point between the two devices. This feature is particularly useful for detecting failures in fiber links and trunks. **Figure 6: UDLD Example:** on page 96 shows an Example:

**Scenario 1 (No UDLD):** Without UDLD, the switch ports remain enabled despite the link failure. Traffic continues to be load-balanced to the ports connected to the failed link.

**Scenario 2 (UDLD-enabled):** When UDLD is enabled, the feature blocks the ports connected to the failed link.

In this Example:, each switch load balances traffic across two ports in a trunk group. Without the UDLD feature, a link failure on a link that is not directly attached to one of the switch remains undetected. As a result, each switch continue to send traffic on the ports connected to the failed link. When UDLD is enabled on the trunk ports on each switch, the switches detect the failed link, block the ports connected to the failed link, and use the remaining ports in the trunk group to forward the traffic.

Similarly, UDLD is effective for monitoring fiber optic links that use two uni-direction fibers to transmit and receive packets. Without UDLD, if a fiber breaks in one direction, a fiber port may assume the link is still good (because the other direction is operating normally) and continue to send traffic on the connected ports. UDLD-enabled ports; however, will prevent traffic from being sent across a bad link by blocking the ports in the event that either the individual transmitter or receiver for that connection fails.

Ports enabled for UDLD exchange health-check packets once every five seconds (the link-keepalive interval). If a port does not receive a health-check packet from the port at the other end of the link within the keepalive interval, the port waits for four more intervals. If the port still does not receive a health-check packet after waiting for five intervals, the port concludes that the link has failed and blocks the UDLD-enabled port.

When a port is blocked by UDLD, the event is recorded in the switch log or via an SNMP trap (if configured); and other port blocking protocols, like spanning tree or meshing, will not use the bad link to load balance packets. The port will remain blocked until the link is unplugged, disabled, or fixed. The port can also be unblocked by disabling UDLD on the port.
Configuring UDLD

When configuring UDLD, keep the following considerations in mind:

- UDLD is configured on a per-port basis and must be enabled at both ends of the link. See the note below for a list of switches that support UDLD.
- To configure UDLD on a trunk group, you must configure the feature on each port of the group individually. Configuring UDLD on a trunk group’s primary port enables the feature on that port only.
- Dynamic trunking is not supported. If you want to configure a trunk group that contains ports on which UDLD is enabled, you must remove the UDLD configuration from the ports. After you create the trunk group, you can re-add the UDLD configuration.

Configuring uni-directional link detection (UDLD) (CLI)

For detailed information about UDLD, see Uni-directional link detection (UDLD) on page 96.

Syntax:

```
[no] interface <port-list> link-keepalive
```

Enables UDLD on a port or range of ports.
To disable this feature, enter the no form of the command.

Default: UDLD disabled

Syntax:

```
link-keepalive interval <interval>
```

Determines the time interval to send UDLD control packets. The `interval` parameter specifies how often the ports send a UDLD packet. You can specify from 10 to 100, in 100-ms increments, where 10 is 1 second, 11 is 1.1 seconds, and so on.

Default: 50 (5 seconds)

Syntax:

```
link-keepalive retries <num>
```

Determines the maximum number of retries to send UDLD control packets. The `num` parameter specifies the maximum number of times the port will try the health check. You can specify a value from 3 to 10.

Default: 5

Syntax:

```
[no] interface <port-list> link-keepalive vlan <vid>
```

Assigns a VLAN ID to a UDLD-enabled port for sending tagged UDLD control packets. Under default settings, untagged UDLD packets can still be transmitted and received on tagged only ports; however, a warning message is logged.

The no form of the command disables UDLD on the specified ports.

Default: UDLD packets are untagged; tagged-only ports transmit and receive untagged UDLD control packets

Enabling UDLD (CLI)

UDLD is enabled on a per-port basis.
Example:
To enable UDLD on port a1, enter:
```
switch(config)#interface a1 link-keepalive
```
To enable the feature on a trunk group, enter the appropriate port range. For example:
```
switch(config)#interface a1-a4 link-keepalive
```

**NOTE:**
When at least one port is UDLD-enabled, the switch will forward out UDLD packets that arrive on non-UDLD-configured ports out of all other non-UDLD-configured ports in the same vlan. That is, UDLD control packets will "pass through" a port that is not configured for UDLD. However, UDLD packets will be dropped on any blocked ports that are not configured for UDLD.

### Changing the keepalive interval (CLI)

By default, ports enabled for UDLD send a link health-check packet once every 5 seconds. You can change the interval to a value from 10 to 100 deciseconds, where 10 is 1 second, 11 is 1.1 seconds, and so on.

**Example:**
To change the packet interval to seven seconds, enter the following command at the global configuration level:
```
switch(config)# link-keepalive interval 70
```

### Changing the keepalive retries (CLI)

By default, a port waits 5 seconds to receive a health-check reply packet from the port at the other end of the link. If the port does not receive a reply, the port tries four more times by sending up to four more health-check packets. If the port still does not receive a reply after the maximum number of retries, the port goes down.

You can change the maximum number of keepalive attempts to a value from 3 to 10.

**Example:**
To change the maximum number of attempts to four, enter the following command at the global configuration level:
```
switch(config)# link-keepalive retries 4
```

### Configuring UDLD for tagged ports

The default implementation of UDLD sends the UDLD control packets untagged, even across tagged ports. If an untagged UDLD packet is received by a non-HPE switch, that switch may reject the packet. To avoid such an occurrence, you can configure ports to send out UDLD control packets that are tagged with a specified VLAN.

To enable ports to receive and send UDLD control packets tagged with a specific VLAN ID, enter a command such as the following at the interface configuration level:
```
switch(config)#interface link-keepalive vlan 22
```
NOTE:

- You must configure the same VLANs that will be used for UDLD on all devices across the network; otherwise, the UDLD link cannot be maintained.
- If a VLAN ID is not specified, UDLD control packets are sent out of the port as untagged packets.
- To re-assign a VLAN ID, re-enter the command with the new VLAN ID number. The new command overwrites the previous command setting.
- When configuring UDLD for tagged ports, you may receive a warning message if there are any inconsistencies with the VLAN configuration of the port.

Viewing UDLD information (CLI)

Syntax:

show link-keepalive
Displays all the ports that are enabled for link-keepalive.

Syntax:

show link-keepalive statistics
Displays detailed statistics for the UDLD-enabled ports on the switch.

Syntax:

clear link-keepalive statistics
Clears UDLD statistics. This command clears the packets sent, packets received, and transitions counters in the show link-keepalive statistics display.

Viewing summary information on all UDLD-enabled ports (CLI)

Enter the show link-keepalive command.

Example:

Figure 7: Example: of show link-keepalive command

<table>
<thead>
<tr>

</tbody>
</table>
Viewing detailed UDLD information for specific ports (CLI)

Enter the `show link-keepalive statistics` command.

Example:

**Figure 8: Example: of show link-keepalive statistics command**

```
Switch(config)# show link-keepalive statistics
Port: 1
Current State: up  Neighbor MAC Addr: 0000a1-b1c1d1
Udld Packets Sent: 1000  Neighbor Port: 5
Udld Packets Received: 1000  State Transitions: 2
Port Blocking: no  Link-vlan: 1

Port: 2
Current State: up  Neighbor MAC Addr: 00102-03405
Udld Packets Sent: 500  Neighbor Port: 6
Udld Packets Received: 450  State Transitions: 3
Port Blocking: no  Link-vlan: 200

Port: 3
Current State: off line  Neighbor MAC Addr: n/a
Udld Packets Sent: 0  Neighbor Port: n/a
Udld Packets Received: 0  State Transitions: 0
Port Blocking: no  Link-vlan: 1

Port: 4
Current State: failure  Neighbor MAC Addr: n/a
Udld Packets Sent: 128  Neighbor Port: n/a
Udld Packets Received: 50  State Transitions: 0
Port Blocking: yes  Link-vlan: 1
```

Clearing UDLD statistics (CLI)

Enter the following command:

```
switch# clear link-keepalive statistics
```

This command clears the packets sent, packets received, and transitions counters in the `show link keepalive statistics` display (see **Figure 8: Example: of show link-keepalive statistics command** on page 100 for an Example:).

**Uplink failure detection**

Uplink Failure Detection (UFD) is a network path redundancy feature that works in conjunction with NIC teaming functionality. UFD continuously monitors the link state of the ports configured as links-to-monitor (LtM), and when these ports lose link with their partners, UFD will disable the set of ports configured as links-to-disable (LtD.) When an uplink port goes down, UFD enables the switch to auto-disable the specific downlinks connected to the NICs. This allows the NIC teaming software to detect link failure on the primary NIC port and fail over to the secondary NIC in the team.

NIC teams must be configured for switch redundancy when used with UFD, that is, the team spans ports on both Switch A and Switch B. The switch automatically enables the downlink ports when the uplink returns to service. For an example of teamed NICs in conjunction with UFD, see **Figure 9: Teamed NICs in conjunction with UFD** on page 101. For an example of teamed NICs with a failed uplink, see **Figure 10: Teamed NICs with a failed uplink** on page 101.
NOTE: For UFD functionality to work as expected, the NIC teaming must be in Network Fault Tolerance (NFT) mode.

Figure 9: Teamed NICs in conjunction with UFD

Figure 10: Teamed NICs with a failed uplink

Configuration guidelines for UFD

Below is a list of configuration guidelines to be followed for UFD. These are applicable only to blade switches where there is a clear distinction between downlink and uplink ports.
1. UFD is required only when uplink-path redundancy is not available on the blade switches.

2. An LtM can be either one or more uplink ports or one or more multi-link trunk group of uplink ports.

3. Ports that are already members of a trunk group are not allowed to be assigned to an LtM or LtD.

4. A trunk group configured as an LtM can contain multiple uplink ports, but no downlink ports or ISL (Inter-Switch-Link) ports.

5. A port cannot be added to a trunk group if it already belongs to an LtM or LtD.

6. An LtD can contain one or more ports, and/or one or more trunks

7. A trunk group configured as an LtD can contain multiple downlink ports, but no uplink ports or ISL (Inter-Switch-Link) ports.

A common API will be provided for higher layers, like CLI and SNMP, which will determine if a port-list can be an LtM or LtD. The API will handle the platform specific details and ensure a uniform code flow for blade and other switch families.

NOTE:
ProCurve and TOR switches do not have a clear distinction between uplink and downlink ports so some of the points listed above may not be applicable.

**UFD enable/disable**

**Syntax:**

```
uplink-failure-detection
```

Used to globally enable UFD. The `[no]` option globally disables UFD.

**UFD track data configuration**

**Syntax:**

```
uplink-failure-detection-track <track-id> links-to-monitor <port-list> links-to-disable <port-list>
```

Used to configure ports given as LtM and ports given as LtD for track-id. This command will also accept trunk interfaces.

**Options**

```
[no] ufd track-id <track-id>
```

From within track-id context:

```
[no] links-to-monitor <port-list>
[no] links-to-disable <port-list>
```

```
uplink-failure-detection-track
```

```
switch(config)# uplink-failure-detection-track 10 links-to-monitor 18,19,20 links-to-disable 1,2,3
```

The above command is used to configure ports 18,19,20 as LtM and ports 1,2,3 as LtD for track-id 10.

```
switch(config)# no uplink-failure-detection-track 10
```

This command will remove any track data associated with track-id 10.

```
switch(config)# no uplink-failure-detection-track 10 links-to-monitor 18 links-to-disable 1
```

This command will remove port 18 as LtM and port 1 as LtD from track-id 10. This command can be issued from track-id context as well.

### UFD minimum uplink threshold configuration

**Syntax:**

```
uplink-failure-detection-track <track-id> minimum-uplink-threshold <threshold value>
```

Configures the minimum uplink threshold value to a number which is the same as the number of LtM ports that must fail to trigger the disabling of LtD ports. This number of LtM ports must be up to enable the LtD ports if in disable state.

**failure-count**

Specify the number of monitored links that must fail before disabling links-to-disable ports.

**all**

Set the failure-count equal to the number of links-to-monitor ports configured. Default is all.

**<NUMBER>**

The number of ports to be set as links-to-monitor ports failure count.

**Options**

Inside a track-id context:

```
monitor-threshold treshold value | all
```

### show uplink-failure-detection

**Syntax:**

```
show uplink-failure-detection
```

```
switch(config)# show uplink-failure-detection
```

**Uplink Failure Detection Information**

```
Uplink Failure Detection Information
UFD Enabled   : Yes
Track ID | Monitored Links to Disable LtM State LtD State LtM Lacp Key LtD Lacp Key
------- + -------------------------- ------ ------ -------------- -------- --------
 1      | Dyn1             Dyn2      Up     Up             100      200
 2      |                  Down     Auto-Disabled 300      400
 3      | 1                D3        Up     Up
 10     | 2,3              D4,D5     Down     Auto-Disabled
 11     | Trk1             D6        Up     Up
```
**UFD operating notes**

- A port cannot be added to a trunk group if it already belongs to an LtM or LtD.
- Ports that are already members of a trunk group cannot be assigned to an LtM or LtD.
- Trunks that are configured as LtM or LtD cannot be deleted.

---

**Configuring ports as LtM and LtD for track 3**

```plaintext
(Switch_name#) uplink-failure-detection track 3 links-to-monitor 5,6,7
links-to-disable 8,9,10
```

**Removing a LtM port and an LtD port for track 3**

```plaintext
(Switch_name#) no uplink-failure-detection track 3 links-to-monitor 5
links-to-disable 8
```

---

**Error log**

UFD will log messages in the following scenarios

- Admin status change.
- When an LtM looses link to its partner and as a result number of LtM ports down becomes equal or greater than the LtM failure count, UFD will disable the LtD.
- When an LtM returns to service and as a result the number of LtM ports down becomes lesser than the LtM failure count, UFD auto-enables the LtD.

---

**Invalid port error messages**

- When a user specifies an invalid LtM port, a message similar to the following is displayed: *Invalid port(s) specified as links-to-monitor.*
- When a user specifies an invalid LtD port, a message similar to the following is displayed: *Invalid port(s) specified as links-to-disable.*
- When user specifies an invalid threshold value an error message similar to the following is displayed: *Invalid threshold value.*
- When user tries to configure threshold value greater then number of LtM ports configured an error message similar to the following is displayed: *Invalid port(s) specified as links-to-disable.*
- When a user specifies an invalid LtD port an error message similar to the following is displayed: *Invalid port(s) specified as links-to-disable.*

---

**Basic USB port commands**

*NOTE:* The USB port is available only on the 2930M Switch Series.
**usb-port**

**Syntax**

usb-port

no usb-port

**Description**

Enables the USB port.

The `no` form of the command disables the USB port and any access to the device.

**Command context**

Config

**show usb-port**

**Syntax**

show usb-port

**Description**

Displays the status of the USB port. It can be enabled, disabled, or not present.

**Command context**

operator

**Usage**

One of the following messages indicates the presence or absence of a USB device:

- Not able to sense device in USB port
- USB device detected in port
- no USB device detected in port

**Example**

Display USB port status.

```
switch# show usb-port
USB port status: enabled
USB port power status: power on   (USB device detected in port)
```
Introduction to PoE

PoE technology allows IP telephones, wireless LAN access points, and other appliances to receive power and transfer data over existing ethernet LAN cabling. For more information about PoE technology, see the PoE/PoE+ planning and implementation guide, which is available on the Networking website at http://www.hpe.com/networking. Enter your Switch number.

Additionally, PoE+ provides more power-management capability, allowing the switch to have more power available for more PDs. Power can be allocated exactly and automatically according to what the PD actually requires at a given time.

PoE terminology

PoE and PoE+ operate similarly in most cases. Any differences between PoE and PoE+ operation are noted; otherwise, the term "PoE" is used to designate both PoE and PoE+ functionality.

Planning and implementing a PoE configuration

This section provides an overview of some considerations for planning a PoE application. For additional information on this topic, refer to the PoE/PoE+ planning and implementation guide which is available on the Networking web site at http://www.hpe.com/networking.

Some of the elements you may want to consider for a PoE installation include:

- Port assignments to VLANs
- Use of security features
- Power requirements

This section can help you to plan your PoE installation. If you use multiple VLANs in your network, or if you have concerns about network security, you should read the first two topics. If your PoE installation comes close to (or is likely to exceed) the system’s ability to supply power to all devices that may request it, then you should also read the third topic. (If it is unlikely that your installation will even approach a full utilization of the PoE power available, then you may find it unnecessary to spend much time on calculating PoE power scenarios.)

Power requirements

To get the best PoE performance, you should provide enough PoE power to exceed the maximum amount of power that is needed by all the PDs that are being used.

By connecting an external power supply you can optionally provision more PoE wattage per port and or supply the switch with redundant 12V power to operate should an internal power supply fail.

See the PoE/PoE+ planning and implementation guide for detailed information about the PoE/PoE+ power requirements for your switch.

Assigning PoE ports to VLANs

If your network includes VLANs, you may want to assign various PoE-configured ports to specific VLANs. For example, if you are using PoE telephones in your network, you may want to assign ports used for telephone access to a VLAN reserved for telephone traffic.
Applying security features to PoE configurations

You can use the port security features built into the switch to control device or user access to the network through PoE ports in the same way as non-PoE ports. Using Port Security, you can configure each switch port with a unique list of MAC addresses for devices that are authorized to access the network through that port. For more information, refer to the titled “Configuring and Monitoring Port Security” in the access security guide for your switch.

Assigning priority policies to PoE traffic

You can use the configurable QoS (Quality of Service) features in the switch to create prioritization policies for traffic moving through PoE ports. The table below lists the available classifiers and their order of precedence.

Table 6: Classifiers for prioritizing outbound packets

<table>
<thead>
<tr>
<th>Priority</th>
<th>QoS classifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>UDP/TCP application type (port)</td>
</tr>
<tr>
<td>2</td>
<td>Device priority (destination or source IP address)</td>
</tr>
<tr>
<td>3</td>
<td>IP type of service (ToS) field (IP packets only)</td>
</tr>
<tr>
<td>4</td>
<td>VLAN priority</td>
</tr>
<tr>
<td>5</td>
<td>Incoming source-port on the switch</td>
</tr>
<tr>
<td>6</td>
<td>Incoming 802.1 priority (present in tagged VLAN environments)</td>
</tr>
</tbody>
</table>

For more on this topic, refer to the titled “Quality of Service: Managing Bandwidth More Effectively” in the advanced traffic management guide for your switch.

PoE operation

Using the commands described in this chapter, you can:

- Enable or disable PoE operation on individual ports.
- Monitor PoE status and performance.
- Configure a non-default power threshold for SNMP and Event Log reporting of PoE consumption on either all PoE ports on the switch or on all PoE ports.
- Specify the port priority you want to use for provisioning PoE power in the event that the PoE resources become oversubscribed.

A PSE detects the power needed by a connected PD before supplying that power via a phase referred to as "searching". If the PSE cannot supply the required amount of power, it does not supply any power. For PoE using a Type 1 device, a PSE will not supply any power to a PD unless the PSE has at least 17 watts available. For example, if a PSE has a maximum available power of 382 watts and is already supplying 378 watts, and is then connected to a PD requiring 10 watts, the PSE will not supply power to the PD.

For PoE+ using Type 2 devices, the PSE must have at least 33 watts available.

Configuration options

In the default configuration, all ports in a switch covered in this guide are configured to support PoE operation. You can:
• Disable or re-enable per-port PoE operation on individual ports to help control power usage and avoid oversubscribing PoE resources.

• Configure per-port priority for allocating power in case a PoE device becomes oversubscribed and must drop power for some lower-priority ports to support the demand on other, higher-priority ports.

• Manually allocate the amount of PoE power for a port by usage, value, or class.

• Allocate PoE power based on the link-partner’s capabilities via LLDP.

**NOTE:**
The ports support standard networking links and PoE links. You can connect either a non-PoE device or a PD to a port enabled for PoE without reconfiguring the port.

**PD support**
To best utilize the allocated PoE power, spread your connected PoE devices as evenly as possible. Depending on the amount of power the power supply device delivers to a PoE switch, there may or may not always be enough power available to connect and support PoE operation on all the ports. When a new PD connects to a PoE switch and the switch does not have enough power left for that port:

• If the new PD connects to a port “X” having a higher PoE priority than another port “Y” that is already supporting another PD, then the power is removed from port “Y” and delivered to port “X”. In this case the PD on port “Y” loses power and the PD on port “X” receives power.

• If the new PD connects to a port “X” having a lower priority than all other PoE ports currently providing power to PDs, then power is not supplied to port “X” until one or more PDs using higher priority ports are removed.

In the default configuration (**usage**), when a PD connects to a PoE port and begins operating, the port retains only enough PoE power to support the PD’s operation. Unused power becomes available for supporting other PD connections. However, if you configure the `poe-allocate-by` option to either **value** or **class**, all of the power configured is allocated to the port.

For PoE (not PoE+), while 17 watts must be available for a PoE module on the switch to begin supplying power to a port with a PD connected, 17 watts per port is not continually required if the connected PD requires less power. For example, with 20 watts of PoE power remaining available on a module, you can connect one new PD without losing power to any connected PDs on that module. If that PD draws only 3 watts, 17 watts remain available, and you can connect at least one more PD to that module without interrupting power to any other PoE devices connected to the same module. If the next PD you connect draws 5 watts, only 12 watts remain unused. With only 12 unused watts available, if you then connect yet another PD to a higher-priority PoE port, the lowest-priority port on the module loses PoE power and remains unpowered until the module once again has 17 or more watts available. (For information on power priority, see **Power priority operation** on page 108.)

For PoE+, there must be 33 watts available for the module to begin supplying power to a port with a PD connected.

Disconnecting a PD from a PoE port makes that power available to any other PoE ports with PDs waiting for power. If the PD demand for power becomes greater than the PoE power available, power is transferred from the lower-priority ports to the higher-priority ports. (Ports not currently providing power to PDs are not affected.)

**Power priority operation**

**When is power allocation prioritized?**
If a PSE can provide power for all connected PD demand, it does not use its power priority settings to allocate power. However, if the PD power demand oversubscribes the available power, then the power allocation is prioritized to the ports that present a PD power demand. This causes the loss of power from one or more lower-
priority ports to meet the power demand on other, higher-priority ports. This operation occurs regardless of the order in which PDs connect to the switch’s PoE-enabled ports.

**How is power allocation prioritized?**

There are two ways that PoE power is prioritized:

- Using a **priority class** method, a power priority of **Low** (the default), **High**, or **Critical** is assigned to each enabled PoE port.
- Using a **port-number priority** method, a lower-numbered port has priority over a higher-numbered port within the same configured priority class. For example, port A1 has priority over port A5 if both are configured with **High** priority.

### Configuring PoE operation

In the default configuration, PoE support is enabled on the ports in a PoE switch. The default priority for all ports is **Low** and the default power notification threshold is **80 (%)**.

Using the CLI, you can:

- Disable or re-enable PoE operation on individual PoE ports
- Enable support for pre-standard devices
- Change the PoE priority level on individual PoE ports
- Change the threshold for generating a power level notice
- Manually allocate the amount of PoE power for a port by usage, value, or class
- Allocate PoE power based on the link-partner’s capabilities via LLDP

### Disabling or re-enabling PoE port operation

Syntax:

```
[no] interface <port-list> power-over-ethernet
```

Re-enables PoE operation on `<port-list>` and restores the priority setting in effect when PoE was disabled on `<port-list>`.

The **no** form of the command disables PoE operation on `<port-list>`.

Default: All PoE ports are initially enabled for PoE operation at **Low** priority. If you configure a higher priority, this priority is retained until you change it.

### Enabling support for pre-standard devices

The switches covered in this guide also support some pre-802.3af devices. For a list of the supported devices, see the FAQ for your switch model.

Syntax:

```
[no] power-over-ethernet pre-std-detect
```

Detects and powers pre-802.3af standard devices.
NOTE: The default setting for the pre-std-detect PoE parameter changed. In earlier software the default setting is “on”. The default setting is “off”.

Configuring the PoE port priority

Syntax:

interface <port-list> power-over-ethernet [critical | high | low]

Reconfigures the PoE priority level on <port-list>. For a given level, ports are prioritized by port number in ascending order. For example, if ports A1-A24 have a priority level of critical, port A1 has priority over ports A2-A24.

If there is not enough power available to provision all active PoE ports at a given priority level, the lowest-numbered port at that level is provisioned first. PoE priorities are invoked only when all active PoE ports cannot be provisioned (supplied with PoE power)

<table>
<thead>
<tr>
<th>Critical</th>
<th>Specifies the highest-priority PoE support for &lt;port-list&gt;. The active PoE ports at this level are provisioned before the PoE ports at any other level are provisioned.</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
<td>Specifies the second priority PoE support for &lt;port-list&gt;. The active PoE ports at this level are provisioned before the Low priority PoE ports are provisioned.</td>
</tr>
<tr>
<td>Low</td>
<td>(Default) Specifies the third priority PoE support for &lt;port-list&gt;. The active PoE ports at this level are provisioned only if there is power available after provisioning any active PoE ports at the higher priority levels.</td>
</tr>
</tbody>
</table>

Controlling PoE allocation

The default option for PoE allocation is usage, which is what a PD attached to the port is allocated. You can override this value by specifying the amount of power allocated to a port by using the class or value options.

Syntax:

[no] int <port-list> poe-allocate-by [usage | class | value]

Allows you to manually allocate the amount of PoE power for a port by either its class or a defined value.

| usage | The automatic allocation by a PD |
| class | Uses the power ramp-up signature of the PD to identify which power class the device will be in. Classes and their ranges are shown in the table below. |
| value | A user-defined level of PoE power allocated for that port. |

NOTE: The allowable PD requirements are lower than those specified for PSEs to allow for power losses along the Cat-5 cable.
Table 7: Power classes and their values

<table>
<thead>
<tr>
<th>Power class</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Depends on cable type and PoE architecture. Maximum power level output of 15.4 watts at the PSE. This is the default class; if there is not enough information about the load for a specific classification, the PSE classifies the load as class 0 (zero).</td>
</tr>
<tr>
<td>1</td>
<td>Requires at least 4 watts at the PSE.</td>
</tr>
<tr>
<td>2</td>
<td>Requires at least 7 watts at the PSE.</td>
</tr>
<tr>
<td>3</td>
<td>15.4 watts</td>
</tr>
<tr>
<td>4</td>
<td>For PoE+ Maximum power level output of 30 watts at the PSE.</td>
</tr>
</tbody>
</table>

Example:
To allocate by class for ports 6 to 8:
`switch(config)# int 6-8 PoE-allocate-by class`

Manually configuring PoE power levels

You can specify a power level (in watts) allocated for a port by using the `value` option. This is the maximum amount of power that will be delivered.

To configure a port by value:

Procedure

1. Set the PoE allocation by entering the `poe-allocate-by value` command:
   ```
   switch(config) # int A6 poe-allocate-by value
   ```
   or in interface context:
   ```
   switch(eth-A6) # poe-allocate-by value
   ```

2. Select a value:
   ```
   switch(config) # int A6 poe-value 15
   ```
   or in interface context:
   ```
   switch(eth-A6) # poe-value 15
   ```
To view the settings, enter the `show power-over-ethernet` command, shown in Figure 11: PoE allocation by value and the maximum power delivered on page 112.

**Figure 11: PoE allocation by value and the maximum power delivered**

```
switch(config)# show power-over-ethernet A6

Status and Counters - Port Power Status for port A6

Power Enable     : Yes                                               LLDP Detect     : enabled
Priority         : low                                                Configured Type :
AllocateBy       : value                                              Value           : 15 W
Detection Status : Delivering                                      Power Class     : 2
Over Current Cnt : 0                                               MPS Absent Cnt  : 0
Power Denied Cnt : 0                                               Short Cnt       : 0
Voltage          : 55.1 V                                            Current         : 154 mA
Power            : 8.4 W

1Maximum power delivered.
```

If you set the PoE maximum value to less than what the PD requires, a fault occurs, as shown in Figure 12: PoE power value set too low for the PD on page 112.

**Figure 12: PoE power value set too low for the PD**

```
switch(config)# int A7 poe-value 4

switch(config)# show power-over-ethernet A7

Status and Counters - Port Power Status for port A7

Power Enable     : Yes                                               LLDP Detect     : enabled
Priority         : low                                                Configured Type :
AllocateBy       : value                                              Value           : 4 W

Power            : 8.4 W

1Fault' appears when the PoE power value is set too low.

**Configuring PoE redundancy**

When PoE redundancy is enabled, PoE redundancy occurs automatically. The switch keeps track of power use and will not supply PoE power to additional PoE devices trying to connect if that results in the switch not having enough power in reserve for redundancy if one of the power supplies should fail.

**Syntax:**

```
[no] power-over-ethernet redundancy [n+1 | full]
```
Allows you to set the amount of power held in reserve for redundancy.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>no</strong></td>
<td>Means that all available power can be allocated to PDs. Default: No PoE redundancy enforced.</td>
</tr>
<tr>
<td><strong>n+1</strong></td>
<td>One of the power supplies is held in reserve for redundancy. If a single power supply fails, no powered devices are shut down. If power supplies with different ratings are used, the highest-rated power supply is held in reserve to ensure full redundancy.</td>
</tr>
<tr>
<td><strong>full</strong></td>
<td>Half of the available power supply is held in reserve for redundancy. If power supplies with different ratings are used, the highest-rated power supply is held in reserve to ensure full redundancy.</td>
</tr>
</tbody>
</table>

For more information about PoE redundancy and power supplies, see the PoE/PoE+ planning and implementation guide, available on the website at [http://www.hpe.com/networking](http://www.hpe.com/networking). Auto search the model number for your switch, for example, “Aruba switch 2930”, then select the device from the list, and click on Product manuals. Click on the “Setup and install — general” link under Manuals.

**Changing the threshold for generating a power notice**

You can configure one of the following thresholds:

- A global power threshold that applies to all ports on the switch. This setting acts as a trigger for sending a notice when the PoE power consumption on any PoE port installed in the switch crosses the configured global threshold level. (Crossing the threshold level in either direction—PoE power usage either increasing or decreasing—triggers the notice.) The default setting is 80%.

- A per-slot power threshold that applies to an individual PoE module installed in the designated slot. This setting acts as a trigger for sending a notice when the module in the specified slot exceeds or goes below a specific level of PoE power consumption.

**NOTE:** Some switches covered by this manual provide a single fixed slot.

**Syntax:**

```
power-over-ethernet [slot < slot-id-range >] threshold <1-99>
```

This command specifies the PoE usage level (as a percentage of the PoE power available on a module) at which the switch generates a power usage notice. This notice appears as an SNMP trap and a corresponding Event Log message and occurs when a PoE module's power consumption crosses the configured threshold value. That is, the switch generates a notice whenever the power consumption on a module either exceeds or drops below the specified percentage of the total PoE power available on the module.

This command configures the notification threshold for PoE power usage on either a global or per-module (slot) basis.

Without the `[slot PoE <slot-id-range>]` option, the switch applies one power threshold setting on all PoE modules installed in the switch.

**Example:**

Suppose slots A, B, and C each have a PoE module installed. In this case, executing the following command sets the global notification threshold to 70% of available PoE power:

```
switch(config)# power-over-ethernet threshold 70
```
With this setting, if module B is allocated 100 watts of PoE power and is using 68 watts, and then another PD is connected to the module in slot B that uses 8 watts, the 70% threshold of 70 watts is exceeded. The switch sends an SNMP trap and generates this Event Log message:

Slot B POE usage has exceeded threshold of 70%.

If the switch is configured for debug logging, it also sends the Event Log message to the configured debug destination(s).

On any PoE module, if an increasing PoE power load (1) exceeds the configured power threshold (which triggers the log message and SNMP trap), and then (2) later decreases and drops below the threshold again, the switch generates another SNMP trap, plus a message to the Event Log and any configured Debug destinations.

To continue the preceding Example:, if the PoE power usage on the PoE module in slot B drops below 70%, another SNMP trap is generated and you will see this message in the Event Log:

Slot B POE usage is below threshold of 70%.

For a message listing, please see the event log message reference guide for your switch. Go to http://www.hpe.com/networking; auto search the model number for your switch, for Example: “Aruba Switch 2920”, then select the device from the list and click on Product manuals. Click on the “User guide” link under Manuals.

(Default Global PoE Power Threshold: 80). By using the [slot <slot-id-range>] option, you can specify different notification thresholds for different PoE modules installed in the switch. For example, you could set the power threshold for a PoE module in slot “A” to 75% and the threshold for the module in slot “B” to 68% by executing the following two commands:

```
switch(config)# power-over-ethernet slot a threshold 75
switch(config)# power-over-ethernet slot b threshold 68
```

**NOTE:** The last threshold command affecting a given slot supersedes the previous threshold command affecting the same slot. Thus, executing the following two commands in the order shown sets the threshold for the PoE module in slot “D” to 75%, but leaves the thresholds for any PoE modules in the other slots at 90%.

```
switch(config)# power-over-ethernet threshold 90
switch(config)# power-over-ethernet slot d threshold 75
```

If you reverse the order of the above two commands, all PoE modules in the switch will have a threshold of 90%.

### PoE/PoE+ allocation using LLDP information

#### LLDP with PoE

When using PoE, enabling poe-lldp-detect allows automatic power configuration if the link partner supports PoE. When LLDP is enabled, the information about the power usage of the PD is available, and the switch can then comply with or ignore this information. You can configure PoE on each port according to the PD (IP phone, wireless device, and so on) specified in the LLDP field. The default configuration is for PoE information to be ignored if detected through LLDP.

**NOTE:**

Detecting PoE information via LLDP affects only power delivery; it does not affect normal Ethernet connectivity.
Enabling or disabling ports for allocating power using LLDP

Syntax:

\[ \text{int } <\text{port-list}> \text{ poe-lldp-detect [enabled | disabled]} \]

Enables or disables ports for allocating PoE power based on the link-partner's capabilities via LLDP.

Default: Disabled

Example:

You can enter this command to enable LLDP detection:

\[ \text{switch(config) # int A7 poe-lldp-detect enabled} \]

or in interface context:

\[ \text{switch(eth-A7) # poe-lldp-detect enabled} \]

Enabling PoE detection via LLDP TLV advertisement

Use this command and insert the desired port or ports:

\[ \text{switch(config) # lldp config } <\text{port-number}> \text{ medTlvenable poe} \]

LLDP with PoE+

Overview

The data link layer classification DLC for PoE provides more exact control over the power requirement between a PSE and PD. The DLC works in conjunction with the physical layer classification PLC and is mandatory for any Type-2 PD that requires more than 12.95 watts of input power.

\[ \text{NOTE:} \]

DLC is defined as part of the IEEE 802.3at standard.

The power negotiation between a PSE and a PD can be implemented at the physical layer or at the data link layer. After the link is powered at the physical layer, the PSE can use LLDP to repeatedly query the PD to discover the power needs of the PD. Communication over the data link layer allows finer control of power allotment, which makes it possible for the PSE to supply dynamically the power levels needed by the PD. Using LLDP is optional for the PSE but mandatory for a Type 2 PD that requires more than 12.95 watts of power.

If the power needed by the PD is not available, that port is shut off.

PoE allocation

LLDP can negotiate power with a PD by using LLDP MED TLVs (disabled by default). This can be enabled using the \[ \text{int } <\text{port-list}> \text{ poe-lldp-detect [enabled|disabled]} \] command, as shown below. LLDP MED TLVs sent by the PD are used to negotiate power only if the LLDP PoE+ TLV is disabled or inactive; if the LLDP PoE+ TLV is sent as well (not likely), the LLDP MED TLV is ignored.

Enabling PoE-lldp-detect allows the data link layer to be used for power negotiation. When a PD requests power on a PoE port, LLDP interacts with PoE to see if there is enough power to fulfill the request. Power is set at the level requested. If the PD goes into power-saving mode, the power supplied is reduced; if the need for power increases, the amount supplied is increased. PoE and LLDP interact to meet the current power demands.

Syntax:

\[ \text{int } <\text{port-list}> \text{ poe-lldp-detect [enabled | disabled]} \]
Allows the data link layer to be used for power negotiation between a PD on a PoE port and LLDP. Default: Disabled

**Example:**

You can enter this command to enable LLDP detection:

```
switch(config) # int 7 PoE-lldp-detect enabled
```

or in interface context:

```
switch(eth-7) # PoE-lldp-detect enabled
```

**NOTE:**
Detecting PoE information via LLDP affects only power delivery; it does not affect normal Ethernet connectivity.

You can view the settings by entering the `show power-over-ethernet brief` command, as shown in **Port with LLDP configuration information obtained from the device** on page 116.

**Port with LLDP configuration information obtained from the device**

```
switch(config)# show power-over-ethernet brief
```

**Viewing PoE when using LLDP information**

**Viewing LLDP port configuration**

To view information about LLDP port configuration, use the `show lldp config` command.

**Syntax:**

```
show lldp config <port-list>
```

Displays the LLDP port configuration information, including the TLVs advertised.

**LLDP port configuration information with PoE**

```
switch(config)# show lldp config 4
```
LLCP Port Configuration Detail

PortId         : 23
SysName        : Switch
Operating note
The advertisement of power with TLVs for LLDP PoE+ is enabled by default. If LLDP is disabled at runtime and a PD is using PoE+ power that has been negotiated through LLDP, there will be a temporary power drop. The port will begin using PoE+ power through the PLC. This event is recorded in the event log. An Example: message would look like the following:

W 08/04/13 13:35:50 02768 ports: Port A1 PoE power dropped. Exceeded physical classification for a PoE Type1 device (LLDP process disabled)

When LLDP is enabled again, it causes a temporary power drop. This event is also recorded in the event log. An Example: message looks like the following:

W 08/04/13 13:36:31 02771 ports: Port A1 PoE power dropped. Exceeded physical classification due to change in classification type (LLDP process enabled)

Viewing the global PoE power status of the switch

Syntax:

show power-over-ethernet [brief | [[ethernet] <port-list>] | [slot <slot-id-range> | all]]

Displays the switch’s global PoE power status, including:

- **Total Available Power**
  Lists the maximum PoE wattage available to provision active PoE ports on the switch. This is the amount of usable power for PDs.

- **Total Failover Power**
  Lists the amount of PoE power available in the event of a single power supply failure. This is the amount of power the switch can maintain without dropping any PDs.

- **Total Redundancy Power**
  Indicates the amount of PoE power held in reserve for redundancy in case of a power supply failure.

- **Total Remaining Power**
  The amount of PoE power still available.
**show power-over-ethernet command output**

```
switch(config)# show power-over-ethernet

Status and Counters - System Power Status
  Pre-standard Detect : On
  System Power Status : No redundancy
  PoE Power Status     : No redundancy

Chassis power-over-ethernet
  Total Available Power : 600 W
  Total Failover Power  : 300 W
  Total Redundancy Power: 0 W
  Total Used Power      : 9 W +/- 6W
  Total Remaining Power : 591 W

Internal Power
  1 300W/POE /Connected.
  2 300W/POE /Connected.
  3 Not Connected.
  4 Not Connected.

External Power

  EPS2 /Not Connected.
```

**Viewing PoE status on all ports**

**Syntax:**

```
show power-over-ethernet brief
```

Displays the port power status:

<table>
<thead>
<tr>
<th><strong>PoE Port</strong></th>
<th>Lists all PoE-capable ports on the switch.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Power Enable</strong></td>
<td>Shows Yes for ports enabled to support PoE (the default) and No for ports on which PoE is disabled.</td>
</tr>
<tr>
<td><strong>Power Priority</strong></td>
<td>Lists the power priority (Low, High, and Critical) configured on ports enabled for PoE. (For more information on this topic, see Configuring PoE operation on page 109.)</td>
</tr>
<tr>
<td><strong>Alloc by</strong></td>
<td>Displays how PoE is allocated (usage, class, value).</td>
</tr>
</tbody>
</table>

**Table Continued**
<table>
<thead>
<tr>
<th>Alloc Power</th>
<th>The maximum amount of PoE power allocated for that port (expressed in watts). Default: 17 watts for PoE; 33 watts for PoE+.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual Power</td>
<td>The power actually being used on that port.</td>
</tr>
<tr>
<td>Configured Type</td>
<td>If configured, shows the user-specified identifier for the port. If not configured, this field is empty.</td>
</tr>
</tbody>
</table>
| Detection Status | • **Searching:** The port is trying to detect a PD connection.  
• **Delivering:** The port is delivering power to a PD.  
• **Disabled:** On the indicated port, either PoE support is disabled or PoE power is enabled but the PoE module does not have enough power available to supply the port's power needs.  
• **Fault:** The switch detects a problem with the connected PD.  
• **Other Fault:** The switch has detected an internal fault that prevents it from supplying power on that port. |
| Power Class | Shows the 802.3af power class of the PD detected on the indicated port. Classes include:  
• **0:** 0.44 to 12.95 watts can be drawn by the PD. Default class.  
• **1:** 0.44 to 3.84 watts  
• **2:** 3.84 to 6.49 watts  
• **3:** 6.49 to 12.95 watts  
• **4:** For PoE+; up to 25.5 watts can be drawn by the PD |

The `show power-over-ethernet brief` displays this output:

```
switch(config)# show power-over-ethernet brief

Status and Counters - System Power Status

System Power Status  : No redundancy
PoE Power Status     : No redundancy

```
You can also show the PoE information by slot:

### Showing the PoE information by slot

```bash
switch(config)# show power-over-ethernet slot A
```

<table>
<thead>
<tr>
<th>Status and Counters</th>
<th>System Power Status for slot A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Power</td>
<td>408 W</td>
</tr>
<tr>
<td>Power In Use</td>
<td>9 W +/- 6 W</td>
</tr>
</tbody>
</table>

#### Viewing the PoE status on specific ports

**Syntax:**

```
show power-over-ethernet <port-list>
```

Displays the following PoE status and statistics (since the last reboot) for each port in `<port-list>`:

| Power Enable          | Shows **Yes** for ports enabled to support PoE (the default) and **No** for ports on which PoE is disabled. For ports on which power is disabled, this is the only field displayed by `show power-over-ethernet <port-list>`.
| Priority              | Lists the power priority (**Low**, **High**, and **Critical**) configured on ports enabled for PoE. (For more on this topic, see **Configuring PoE operation** on page 109.)
| Allocate by           | How PoE is allocated (**usage**, **class**, **value**).
| Detection Status      | • **Searching:** The port is trying to detect a PD connection.
|                       | • **Delivering:** The port is delivering power to a PD.
|                       | • **Disabled:** On the indicated port, either PoE support is disabled or PoE power is enabled but the PoE module does not have enough power available to supply the port's power needs.
|                       | • **Fault:** The switch detects a problem with the connected PD.
|                       | • **Other Fault:** The switch has detected an internal fault that prevents it from supplying power on that port.
| Over Current Cnt      | Shows the number of times a connected PD has attempted to draw more than 15.4 watts for PoE or 24.5 watts for PoE+. Each occurrence generates an Event Log message.
| Power Denied Cnt      | Shows the number of times PDs requesting power on the port have been denied because of insufficient power available. Each occurrence generates an Event Log message.
| Voltage               | The total voltage, in volts, being delivered to PDs.
| Power                 | The total power, in watts, being delivered to PDs.
| LLDP Detect           | Port is enabled or disabled for allocating PoE power, based on the link-partner's capabilities via LLDP.
| Configured Type       | If configured, shows the user-specified identifier for the port. If not configured, the field is empty.
| Value                 | The maximum amount of PoE power allocated for that port (expressed in watts). Default: **17 watts** for PoE; **33 watts** for PoE+.
Power Class | Shows the power class of the PD detected on the indicated port. Classes include:
- 0: 0.44 to 12.95 watts
- 1: 0.44 to 3.84 watts
- 2: 3.84 to 6.49 watts
- 3: 6.49 to 12.95 watts
- 4: For PoE+; up to 25.5 watts can be drawn by the PD

MPS Absent Cnt | Shows the number of times a detected PD has no longer requested power from the port. Each occurrence generates an Event Log message. ("MPS" refers to the "maintenance power signature.")

Short Cnt | Shows the number of times the switch provided insufficient current to a connected PD.

Current | The total current, in mA, being delivered to PDs.

If you want to view the PoE status of ports A6 and A7, you would use `show power-over-ethernet A6-A7` to display the data:

```
show power-over-ethernet <port-list> output
```

```
switch(config)# show power-over-ethernet slot A6-A7

Status and Counters - Port Power Status for port A6

```

PoE Event Log messages

Please see the event log message reference guide for information about Event Log messages. To see these manuals, go to [http://www.hpe.com/networking](http://www.hpe.com/networking). Auto search the model number for your switch, for Example: “Switch 2920”, then select the device from the list and click on Product manuals. Click on the “User guide” link under Manuals.
Overview of port trunking

Port trunking allows you to assign up to eight physical links to one logical link (trunk) that functions as a single, higher-speed link providing dramatically increased bandwidth. This capability applies to connections between backbone devices as well as to connections in other network areas where traffic bottlenecks exist. A trunk group is a set of up to eight ports configured as members of the same port trunk. The ports in a trunk group do not have to be consecutive. For Example:

Figure 13: Conceptual Example: of port trunking

Port connections and configuration

All port trunk links must be point-to-point connections between a switch and another switch, router, server, or workstation configured for port trunking. No intervening, non-trunking devices are allowed. It is important to note that ports on both ends of a port trunk group must have the same mode (speed and duplex) and flow control settings.

NOTE:

Link connections

The switch does not support port trunking through an intermediate, non-trunking device such as a hub, or using more than one media type in a port trunk group. Similarly, for proper trunk operation, all links in the same trunk group must have the same speed, duplex, and flow control.

Port security restriction

Port security does not operate on a trunk group. If you configure port security on one or more ports that are later added to a trunk group, the switch resets the port security parameters for those ports to the factory-default configuration.

CAUTION:

To avoid broadcast storms or loops in your network while configuring a trunk, first disable or disconnect all ports you want to add to or remove from the trunk. After you finish configuring the trunk, enable or re-connect the ports.
Port trunk features and operation

The switches covered in this guide offer these options for port trunking:

- LACP: IEEE 802.3ad—Trunk group operation using LACP on page 133
- Trunk: Non-Protocol—Trunk group operation using the "trunk" option on page 139

Up to 60 trunk groups are supported on the switches. The actual maximum depends on the number of ports available on the switch and the number of links in each trunk. (Using the link aggregation control protocol—LACP—option, you can include standby trunked ports in addition to the maximum of eight actively trunking ports.) The trunks do not have to be the same size; For example, 100 two-port trunks and 11 eight-port trunks are supported.

NOTE: LACP requires full-duplex (FDx) links of the same media type (10/100Base-T, 100FX, and so on) and the same speed, and enforces speed and duplex conformance across a trunk group. For most installations, Hewlett Packard Enterprise Switch recommends that you leave the port Mode settings at Auto (the default). LACP also operates with Auto-10, Auto-100, and Auto-1000 (if negotiation selects FDx), and 10FDx, 100FDx, and 1000FDx settings. (The 10-gigabit ports available for some switch models allow only the Auto setting.)

Fault tolerance

If a link in a port trunk fails, the switch redistributes traffic originally destined for that link to the remaining links in the trunk. The trunk remains operable as long as there is at least one link in operation. If a link is restored, that link is automatically included in the traffic distribution again. The LACP option also offers a standby link capability, which enables you to keep links in reserve for service if one or more of the original active links fails. (See Trunk group operation using LACP on page 133.)

Trunk configuration methods

Dynamic LACP trunk

The switch automatically negotiates trunked links between LACP-configured ports on separate devices, and offers one dynamic trunk option: LACP. To configure the switch to initiate a dynamic LACP trunk with another device, use the interface command in the CLI to set the default LACP option to active on the ports you want to use for the trunk. For example, the following command sets ports C1 to C4 to LACP active:

```
switch(config) int c1-c4 lacp active
```

The preceding Example: works if the ports are not already operating in a trunk. To change the LACP option on ports already operating as a trunk, you must first remove them from the trunk. For example, if ports C1 to C4 are LACP-active and operating in a trunk with another device, you would do the following to change them to LACP-passive:

```
switch(config)# no int c1-c4 lacp
Removes the ports from the trunk.
switch(config)# int c1-c4 lacp passive
Configures LACP passive.
```

Using keys to control dynamic LACP trunk configuration

The `lacp key` option provides the ability to control dynamic trunk configuration. Ports with the same key will be aggregated as a single trunk.

There are two types of keys associated with each port, the Admin key and the Operational key. The Operational key is the key currently in use. The Admin key is used internally to modify the value of the Operational key. The
Admin and Operational key are usually the same, but using static LACP can alter the Operational key during runtime, in which case the keys would differ.

The `lacp key` command configures both the Admin and Operational keys when using dynamic LACP trunks. It only configures the Admin key if the trunk is a static LACP trunk. It is executed in the interface context.

**Syntax:**

```
[no] lacp [active | passive | key <0-65535>]
```

Sets the LACP key. During dynamic link aggregation using LACP, ports with the same key are aggregated as a single trunk.

---

### Enabling LACP and configuring an LACP key

```bash
switch(config)# int A2-A3 lacp active
switch(config)# int A2-A3 lacp key 500
switch(config)# show lacp
```

<table>
<thead>
<tr>
<th></th>
<th>LACP</th>
<th>Trunk</th>
<th>Port</th>
<th>Status</th>
<th>Partner Status</th>
<th>Key</th>
<th>Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>A2</td>
<td></td>
<td>Active</td>
<td>A2</td>
<td>Down</td>
<td>No</td>
<td>500</td>
<td>500</td>
</tr>
<tr>
<td>A3</td>
<td></td>
<td>Active</td>
<td>A3</td>
<td>Down</td>
<td>No</td>
<td>500</td>
<td>500</td>
</tr>
</tbody>
</table>

---

### An interface configured with a different LACP key

```bash
switch(config)# int A5 lacp active
switch(config)# int A5 lacp key 250
```

```bash
switch# show lacp
```

<table>
<thead>
<tr>

<td>250</td>
<td>250</td>
</tr>
</tbody>
</table>

---

### Static trunk

The switch uses the links you configure with the Port/Trunk Settings screen in the menu interface or the `trunk` command in the CLI to create a static port trunk. The switch offers two types of static trunks: LACP and Trunk.

**Table 8: Trunk types used in static and dynamic trunk groups**

<table>
<thead>
<tr>
<th>Trunking method</th>
<th>LACP</th>
<th>Trunk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Static</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The following table describes the trunking options for LACP and Trunk protocols.
<table>
<thead>
<tr>
<th>Protocol</th>
<th>Trunking Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>LACP (802.3ad)</td>
<td>Provides dynamic and static LACP trunking options.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dynamic LACP</strong> — Use the switch-negotiated dynamic LACP trunk when:</td>
</tr>
<tr>
<td></td>
<td>◦ The port on the other end of the trunk link is configured for Active or Passive LACP.</td>
</tr>
<tr>
<td></td>
<td>◦ You want fault-tolerance for high-availability applications. If you use an eight-link trunk, you can also configure one or more additional links to operate as standby links that will activate only if another active link goes down.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Static LACP</strong> — Use the manually configured static LACP trunk when:</td>
</tr>
<tr>
<td></td>
<td>◦ The port on the other end of the trunk link is configured for a static LACP trunk.</td>
</tr>
<tr>
<td></td>
<td>◦ You want to configure non-default spanning tree or IGMP parameters on an LACP trunk group.</td>
</tr>
<tr>
<td></td>
<td>◦ You want an LACP trunk group to operate in a VLAN other than the default VLAN and GVRP is disabled. (See VLANs and dynamic LACP on page 138.)</td>
</tr>
<tr>
<td></td>
<td>◦ You want to use a monitor port on the switch to monitor an LACP trunk.</td>
</tr>
<tr>
<td></td>
<td>For more information, see Trunk group operation using LACP on page 133.</td>
</tr>
<tr>
<td>Trunk (non-protocol)</td>
<td>Provides manually configured, static-only trunking to:</td>
</tr>
<tr>
<td></td>
<td>• Most Switches and routing switches are not running the 802.3ad LACP protocol.</td>
</tr>
<tr>
<td></td>
<td>• Windows NT and HPE-UX workstations and servers</td>
</tr>
<tr>
<td></td>
<td>Use the Trunk option when:</td>
</tr>
<tr>
<td></td>
<td>• The device to which you want to create a trunk link is using a non-802.3ad trunking protocol.</td>
</tr>
<tr>
<td></td>
<td>• You are unsure which type of trunk to use, or the device to which you want to create a trunk link is using an unknown trunking protocol.</td>
</tr>
<tr>
<td></td>
<td>• You want to use a monitor port on the switch to monitor traffic on a trunk.</td>
</tr>
<tr>
<td></td>
<td>See Trunk group operation using the “trunk” option on page 139.</td>
</tr>
</tbody>
</table>
Table 10: *General operating rules for port trunks*

<table>
<thead>
<tr>
<th>Media:</th>
<th>For proper trunk operation, all ports on both ends of a trunk group must have the same media type and mode (speed and duplex). (For the switches, it is recommended to leave the port mode setting at Auto or, in networks using Cat 3 cabling, Auto-10.)</th>
</tr>
</thead>
</table>
| Port Configuration: | The default port configuration is Auto, which enables a port to sense speed and negotiate duplex with an auto-enabled port on another device. It is recommended that you use the Auto setting for all ports you plan to use for trunking. Otherwise, you must manually ensure that the mode setting for each port in a trunk is compatible with the other ports in the trunk. See: Recommended port mode setting for LACP example. All of the following operate on a per-port basis, regardless of trunk membership:  
  - Enable/Disable  
  - Flow control (Flow Ctrl) |
| Trunk configuration: | All ports in the same trunk group must be the same trunk type (LACP or trunk). All LACP ports in the same trunk group must be either all static LACP or all dynamic LACP. A trunk appears as a single port labeled Dyn1 (for an LACP dynamic trunk) or Trk1 (for a static trunk of type LACP, Trunk) on various menu and CLI screens. For a listing of which screens show which trunk types, see How the switch lists trunk data on page 139. For spanning-tree or VLAN operation, configuration for all ports in a trunk is done at the trunk level. (You cannot separately configure individual ports within a trunk for spanning-tree or VLAN operation.) |
| Traffic distribution: | All of the switch trunk protocols use the SA/DA (source address/destination address) method of distributing traffic across the trunked links. See Outbound traffic distribution across trunked links on page 140. |
### Spanning Tree:

802.1D (STP) and 802.1w (RSTP) Spanning Tree operate as a global setting on the switch (with one instance of Spanning Tree per switch). 802.1s (MSTP) Spanning Tree operates on a per-instance basis (with multiple instances allowed per switch). For each Spanning Tree instance, you can adjust Spanning Tree parameters on a per-port basis. A static trunk of any type appears in the Spanning Tree configuration display, and you can configure Spanning Tree parameters for a static trunk in the same way that you would configure Spanning Tree parameters on a non-trunked port. (Note that the switch lists the trunk by name—such as Trk1—and does not list the individual ports in the trunk.) For example, if ports C1 and C2 are configured as a static trunk named Trk1, they are listed in the Spanning Tree display as Trk1 and do not appear as individual ports in the Spanning Tree displays. See [A port trunk in a Spanning Tree listing](#) on page 129. When Spanning Tree forwards on a trunk, all ports in the trunk will be forwarding. Conversely, when Spanning Tree blocks a trunk, all ports in the trunk are blocked.

A dynamic LACP trunk operates only with the default Spanning Tree settings. Also, this type of trunk appears in the CLI `show spanning-tree` display, but not in the Spanning Tree Operation display of the Menu interface.

If you remove a port from a static trunk, the port retains the same Spanning Tree settings that were configured for the trunk. In the below Example:, ports C1 and C2 are members of TRK1 and do not appear as individual ports in the port configuration part of the listing. See [A port trunk in a Spanning Tree listing example](#).

### IP multicast protocol (IGMP):

A static trunk of any type appears in the IGMP configuration display, and you can configure IGMP for a static trunk in the same way that you would configure IGMP on a non-trunked port. (Note that the switch lists the trunk by name—such as Trk1—and does not list the individual ports in the trunk.) Also, creating a new trunk automatically places the trunk in IGMP Auto status if IGMP is enabled for the default VLAN. A dynamic LACP trunk operates only with the default IGMP settings and does not appear in the IGMP configuration display or `show ip igmp` listing.

### VLANs:

Creating a new trunk automatically places the trunk in the DEFAULT_VLAN, regardless of whether the ports in the trunk were in another VLAN. Similarly, removing a port from a trunk group automatically places the port in the default VLAN. You can configure a static trunk in the same way that you configure a port for membership in any VLAN.

For a dynamic LACP trunk to operate in a VLAN other than the default VLAN (DEFAULT_VLAN), GVRP must be enabled. See [Trunk group operation using LACP](#) on page 133.

### Port security:

Trunk groups (and their individual ports) cannot be configured for port security, and the switch excludes trunked ports from the `show port-security` listing. If you configure non-default port security settings for a port, then subsequently try to place the port in a trunk, you see the following message and the command is not executed: `<port-list>` Command cannot operate over a logical port.

### Monitor port:

A trunk cannot be a monitor port. A monitor port can monitor a static trunk but cannot monitor a dynamic LACP trunk.
Recommended port mode setting for LACP

switch(config)# show interfaces config

</tbody>
</table>

Viewing and configuring port trunk groups (CLI)

You can list the trunk type and group for all ports on the switch or for selected ports. You can also list LACP-only status information for LACP-configured ports.

Viewing static trunk type and group for all ports or for selected ports

Syntax:

```
show trunks [\<\ port-list \>]
```

Omitting the `<port-list>` parameter results in a static trunk data listing for all LAN ports in the switch.

Example:

In a switch where ports A4 and A5 belong to Trunk 1 and ports A7 and A8 belong to Trunk 2, you have the options shown in Listing specific ports belonging to static trunks on page 129 and A show trunk listing without specifying ports on page 130 for displaying port data for ports belonging to static trunks.

Using a port list specifies, for switch ports in a static trunk group, only the ports you want to view. In this case, the command specifies ports A5 through A7. However, because port A6 is not in a static trunk group, it does not appear in the resulting listing:

Listing specific ports belonging to static trunks

```
switch# show trunks e 5-7
```

Load Balancing

<table>
<thead>
<tr>
<th>Port</th>
<th>Name</th>
<th>Type</th>
<th>Group</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Print-Server-Trunk</td>
<td>10/100TX</td>
<td>Trk1</td>
<td>Trunk</td>
</tr>
<tr>
<td>7</td>
<td></td>
<td>10/100TX</td>
<td>Trk2</td>
<td>Trunk</td>
</tr>
</tbody>
</table>

The `show trunks <port-list>` command in the above Example: includes a port list, and thus shows trunk group information only for specific ports that have membership in a static trunk. In A show trunk listing without
A show trunk listing without specifying ports

```
switch# show trunks
Load Balancing
<table>
<thead>
<tr>
<th>Port</th>
<th>Name</th>
<th>Type</th>
<th>Group Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Print-Server-Trunk</td>
<td>10/100TX</td>
<td>Trk1</td>
</tr>
<tr>
<td>5</td>
<td>Print-Server-Trunk</td>
<td>10/100TX</td>
<td>Trk1</td>
</tr>
<tr>
<td>7</td>
<td></td>
<td>10/100TX</td>
<td>Trk2</td>
</tr>
<tr>
<td>8</td>
<td></td>
<td>10/100TX</td>
<td>Trk2</td>
</tr>
</tbody>
</table>
```

Viewing static LACP and dynamic LACP trunk data

**Syntax:**

```
show lacp
```

Lists data for only the LACP-configured ports.

**Example:**

Ports A1 and A2 have been previously configured for a static LACP trunk. (For more on the `Active` parameter, see table "LACP port status data").

```
A show LACP listing

switch# show lacp
LACP
<table>
<thead>
<tr>
<th>Port</th>
<th>LACP</th>
<th>Trunk</th>
<th>Port Status</th>
<th>Partner</th>
<th>LACP Status</th>
<th>Admin Key</th>
<th>Oper Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>Active</td>
<td>Trk1</td>
<td>Up</td>
<td>Yes</td>
<td>Success</td>
<td>0</td>
<td>250</td>
</tr>
<tr>
<td>A2</td>
<td>Active</td>
<td>Trk1</td>
<td>Up</td>
<td>Yes</td>
<td>Success</td>
<td>0</td>
<td>250</td>
</tr>
<tr>
<td>A3</td>
<td>Active</td>
<td>A3</td>
<td>Down</td>
<td>No</td>
<td>Success</td>
<td>0</td>
<td>300</td>
</tr>
<tr>
<td>A4</td>
<td>Passive</td>
<td>A4</td>
<td>Down</td>
<td>No</td>
<td>Success</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>A5</td>
<td>Passive</td>
<td>A5</td>
<td>Down</td>
<td>No</td>
<td>Success</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>A6</td>
<td>Passive</td>
<td>A6</td>
<td>Down</td>
<td>No</td>
<td>Success</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
```

For a description of each of the above-listed data types, see table "LACP port status data".

**Dynamic LACP Standby Links**

Dynamic LACP trunking enables you to configure standby links for a trunk by including more than eight ports in a dynamic LACP trunk configuration. When eight ports (trunk links) are up, the remaining link(s) will be held in standby status. If a trunked link that is "Up" fails, it will be replaced by a standby link, which maintains your intended bandwidth for the trunk. (Refer to also the "Standby" entry under "Port Status" in "Table 4-5. LACP Port Status Data"). In the next Example, ports A1 through A9 have been configured for the same LACP trunk. Notice that one of the links shows Standby status, while the remaining eight links are "Up".

```
A Dynamic LACP trunk with one standby link

switch# show lacp
LACP
```
<table>

</tr>
</tbody>
</table>

### Configuring a static trunk or static LACP trunk group

**IMPORTANT:** Configure port trunking **before** you connect the trunked links between switches. Otherwise, a broadcast storm could occur. (If you need to connect the ports before configuring them for trunking, you can temporarily disable the ports until the trunk is configured. See “Enabling or Disabling Ports and Configuring Port Mode”.)

The "**Port trunk features and operation**" section describes the maximum number of trunk groups you can configure on the switch. An individual trunk can have up to eight links, with additional standby links if you're using LACP. You can configure trunk group types as follows:

<table>
<thead>
<tr>
<th>Trunk Type</th>
<th>Trunk Group Membership</th>
</tr>
</thead>
<tbody>
<tr>
<td>LACP</td>
<td>Yes</td>
</tr>
<tr>
<td>Trunk</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The following examples show how to create different types of trunk groups.

**Syntax:**

```
trunk < port-list > < trk1 ... trk60 > {<trunk | lacp}>
```

Configures the specified static trunk type.

**Example:**

This Example: uses ports C4 to C6 to create a non-protocol static trunk group with the group name Trk2.

```
switch(config)# trunk c4-c6 trk2 trunk
```

### Removing ports from a static trunk group

**CAUTION:** Removing a port from a trunk can create a loop and cause a broadcast storm. When you remove a port from a trunk where spanning tree is not in use, The switch recommends that you first disable the port or disconnect the link on that port.

**Syntax:**

```
no trunk <port-list>
```

Removes the specified ports from an existing trunk group.

**Example:**

To remove ports C4 and C5 from an existing trunk group:
Enabling a dynamic LACP trunk group

In the default port configuration, all ports on the switch are set to disabled. To enable the switch to automatically form a trunk group that is dynamic on both ends of the link, the ports on one end of a set of links must be LACP Active. The ports on the other end can be either LACP Active or LACP Passive. The `active` command enables the switch to automatically establish a (dynamic) LACP trunk group when the device on the other end of the link is configured for LACP Passive.

Example:

Figure 14: Criteria for automatically forming a dynamic LACP trunk

Syntax:

```
interface <port-list> lacp active
```

Configures `<port-list>` as LACP active. If the ports at the other end of the links on `<port-list>` are configured as LACP passive, this command enables a dynamic LACP trunk group on `<port-list>`.

Example:

This Example: uses ports C4 and C5 to enable a dynamic LACP trunk group.

```
switch(config)# interface c4-c5 lacp active
```

Removing ports from a dynamic LACP trunk group

To remove a port from dynamic LACP trunk operation, you must turn off LACP on the port. (On a port in an operating, dynamic LACP trunk, you cannot change between LACP Active and LACP passive without first removing LACP operation from the port.)

CAUTION:

Unless spanning tree is running on your network, removing a port from a trunk can result in a loop. To help prevent a broadcast storm when you remove a port from a trunk where spanning tree is not in use, Hewlett Packard Enterprise recommends that you first disable the port or disconnect the link on that port.
Syntax:

no interface <port-list> lacp

Removes <port-list> from any dynamic LACP trunk and returns the ports in <port-list> to passive LACP.

Example:

Port C6 belongs to an operating, dynamic LACP trunk. To remove port C6 from the dynamic trunk and return it to passive LACP, do the following:

switch(config)# no interface c6 lacp
switch(config)# interface c6 lacp passive

In the above Example:, if the port on the other end of the link is configured for active LACP or static LACP, the trunked link will be re-established almost immediately.

Viewing existing port trunk groups (WebAgent)

While the WebAgent does not enable you to configure a port trunk group, it does provide a view of an existing trunk group.

To view any port trunk groups:

1. In the navigation pane, click Interface.
2. Click Port Info/Config. The trunk information for the port displays in the Port Properties box.

Trunk group operation using LACP

The switch can automatically configure a dynamic LACP trunk group, or you can manually configure a static LACP trunk group.

NOTE: LACP requires full-duplex (FDx) links of the same media type (10/100Base-T, 100FX, and so on) and the same speed and enforces speed and duplex conformance across a trunk group. For most installations, it is recommended that you leave the port mode settings at Auto (the default). LACP also operates with Auto-10, Auto-100, and Auto-1000 (if negotiation selects FDx), and 10FDx, 100FDx, and 1000FDx settings.

LACP trunk status commands include:

<table>
<thead>
<tr>
<th>Trunk display method</th>
<th>Static LACP trunk</th>
<th>Dynamic LACP trunk</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLI show lACP command</td>
<td>Included in listing.</td>
<td>Included in listing.</td>
</tr>
<tr>
<td>CLI show trunk command</td>
<td>Included in listing.</td>
<td>Not included.</td>
</tr>
</tbody>
</table>

Thus, to display a listing of dynamic LACP trunk ports, you must use the show lACP command.

In most cases, trunks configured for LACP on the switches operate as described in the following table.
Table 11: LACP trunk types

<table>
<thead>
<tr>
<th>LACP port trunk configuration</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic LACP</td>
<td>This option automatically establishes an 802.3ad-compliant trunk group, with LACP for the port Type parameter and DynX for the port Group name, where X is an automatically assigned value from , depending on how many dynamic and static trunks are currently on the switch. (The switch allows a maximum of 60 trunk groups in any combination of static and dynamic trunks.) Dynamic LACP trunks operate only in the default VLAN (unless GVRP is enabled and Forbid is used to prevent the trunked ports from joining the default VLAN). Thus, if an LACP dynamic port forms using ports that are not in the default VLAN, the trunk automatically moves to the default VLAN unless GVRP operation is configured to prevent this from occurring. In some cases, this can create a traffic loop in your network. For more information on this topic, see VLANs and dynamic LACP on page 138. Under the following conditions, the switch automatically establishes a dynamic LACP port trunk group and assigns a port Group name: • The ports on both ends of each link have compatible mode settings (speed and duplex). • The port on one end of each link must be configured for LACP Active and the port on the other end of the same link must be configured for either LACP Passive or LACP Active. For Example: Either of the above link configurations allows a dynamic LACP trunk link. Backup Links: A maximum of eight operating links are allowed in the trunk, but, with dynamic LACP, you can configure one or more additional (backup) links that the switch automatically activates if a primary link fails. To configure a link as a standby for an existing eight-port dynamic LACP trunk, ensure that the ports in the standby link are configured as either active-to-active or active-to-passive between switches. Displaying dynamic LACP trunk data: To list the configuration and status for a dynamic LACP trunk, use the CLI show lacp command. The dynamic trunk is automatically created by the switch and is not listed in the static trunk listings available in the menu interface or in the CLI show trunk listing.</td>
</tr>
<tr>
<td>Static LACP</td>
<td>Provides a manually configured, static LACP trunk to accommodate these conditions:</td>
</tr>
<tr>
<td>LACP port trunk configuration</td>
<td>Operation</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------</td>
</tr>
<tr>
<td></td>
<td>• The port on the other end of the trunk link is configured for a static LACP trunk.</td>
</tr>
<tr>
<td></td>
<td>• You want to configure non-default Spanning Tree or IGMP parameters on an LACP trunk group.</td>
</tr>
<tr>
<td></td>
<td>• You want an LACP trunk group to operate in a VLAN other than the default VLAN and GVRP is disabled. (See VLANs and dynamic LACP on page 138.)</td>
</tr>
<tr>
<td></td>
<td>• You want to use a monitor port on the switch to monitor an LACP trunk.</td>
</tr>
</tbody>
</table>

The trunk operates if the trunk group on the opposite device is running one of the following trunking protocols:

- Active LACP
- Passive LACP
- Trunk

This option uses **LACP** for the port Type parameter and **TrkX** for the port Group parameter, where X is an automatically assigned value in a range corresponding to the maximum number of trunks the switch allows. (See Port trunk features and operation for the maximum number of trunk groups allowed on the switches.)

Displaying static LACP trunk data: To list the configuration and status for a static LACP trunk, use the CLI `show lacp` command. To list a static LACP trunk with its assigned ports, use the CLI `show trunk` command or display the menu interface Port/Trunk Settings screen. Static LACP does not allow standby ports.

### Default port operation

In the default configuration, LACP is disabled for all ports. If LACP is not configured as Active on at least one end of a link, the port does not try to detect a trunk configuration and operates as a standard, untrunked port. The following table lists the elements of per-port LACP operation. To display this data for a switch, execute the following command in the CLI:

```
switch# show lacp
```
#### Table 12: LACP port status data

<table>
<thead>
<tr>
<th>Status name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Port Numb</strong></td>
<td>Shows the physical port number for each port configured for LACP operation (C1, C2, C3 …). Unlisted port numbers indicate that the missing ports that are assigned to a static trunk group are not configured for any trunking.</td>
</tr>
<tr>
<td><strong>LACP Enabled</strong></td>
<td><strong>Active</strong>: The port automatically sends LACP protocol packets. <strong>Passive</strong>: The port does not automatically send LACP protocol packets and responds only if it receives LACP protocol packets from the opposite device. A link having either two active LACP ports or one active port and one passive port can perform dynamic LACP trunking. A link having two passive LACP ports does not perform LACP trunking because both ports are waiting for an LACP protocol packet from the opposite device. In the default switch configuration, LACP is disabled for all ports.</td>
</tr>
<tr>
<td><strong>Trunk Group</strong></td>
<td><strong>TrkX</strong>: This port has been manually configured into a static LACP trunk. <strong>Trunk group same as port number</strong>: The port is configured for LACP, but is not a member of a port trunk.</td>
</tr>
<tr>
<td><strong>Port Status</strong></td>
<td><strong>Up</strong>: The port has an active LACP link and is not blocked or in standby mode. <strong>Down</strong>: The port is enabled, but an LACP link is not established. This can indicate, for example, a port that is not connected to the network or a speed mismatch between a pair of linked ports. <strong>Disabled</strong>: The port cannot carry traffic. <strong>Blocked</strong>: LACP, Spanning Tree has blocked the port. (The port is not in LACP standby mode.) This may be caused by a (brief) trunk negotiation or a configuration error, such as differing port speeds on the same link or trying to connect the switch to more trunks than it can support. (See Trunk configuration protocols.) Some older devices are limited to four ports in a trunk. When eight LACP-enabled ports are connected to one of these older devices, four ports connect, but the other four ports are blocked. <strong>Standby</strong>: The port is configured for dynamic LACP trunking to another device, but the maximum number of ports for the dynamic trunk to that device has already been reached on either the switch or the other device. This port will remain in reserve, or &quot;standby&quot; unless LACP detects that another active link in the trunk has become disabled, blocked, or down. In this case, LACP automatically assigns a standby port, if available, to replace the failed port.</td>
</tr>
<tr>
<td><strong>LACP Partner</strong></td>
<td><strong>Yes</strong>: LACP is enabled on both ends of the link. <strong>No</strong>: LACP is enabled on the switch, but either LACP is not enabled or the link has not been detected on the opposite device.</td>
</tr>
<tr>
<td><strong>LACP Status</strong></td>
<td><strong>Success</strong>: LACP is enabled on the port, detects and synchronizes with a device on the other end of the link, and can move traffic across the link. <strong>Failure</strong>: LACP is enabled on a port and detects a device on the other end of the link, but is not able to synchronize with this device, and therefore is not able to send LACP packets across the link. This can be caused, for example, by an intervening device on the link (such as a hub), a bad hardware connection, or if the LACP operation on the opposite device does not comply with the IEEE 802.3ad standard.</td>
</tr>
</tbody>
</table>
LACP notes and restrictions

802.1X (Port-based access control) configured on a port

To maintain security, LACP is not allowed on ports configured for 802.1X authenticator operation. If you configure port security on a port on which LACP (active or passive) is configured, the switch removes the LACP configuration, displays a notice that LACP is disabled on the port, and enables 802.1X on that port.

```
switch(config)# aaa port-access authenticator b1
LACP has been disabled on 802.1x port(s).
switch(config)#
```

The switch does not allow you to configure LACP on a port on which port access (802.1X) is enabled. For Example:

```
switch(config)# int b1 lacp passive
Error configuring port < port-number > : LACP and 802.1x cannot be run together.
switch(config)#
```

To restore LACP to the port, you must first remove the 802.1X configuration of the port and then re-enable LACP active or passive on the port.

Port security configured on a port

To maintain security, LACP is not allowed on ports configured for port security. If you configure port security on a port on which LACP (active or passive) is configured, the switch removes the LACP configuration, displays a notice that LACP is disabled on the port, and enables port security on that port. For example:

```
switch(config)# port-security a17 learn-mode static address-limit 2 LACP has been disabled on secured port(s).
switch(config)#
```

The switch does not allow you to configure LACP on a port on which port security is enabled. For example:

```
switch(config)# int a17 lacp passive
Error configuring port A17: LACP and port security cannot be run together.
switch(config)#
```

To restore LACP to the port, you must remove port security and re-enable LACP active or passive.

Changing trunking methods

To convert a trunk from static to dynamic, you must first eliminate the static trunk.

Static LACP trunks

When a port is configured for LACP (active or passive), but does not belong to an existing trunk group, you can add that port to a static trunk. Doing so disables dynamic LACP on that port, which means you must manually configure both ends of the trunk.

Dynamic LACP trunks

You can configure a port for LACP-active or LACP-passive, but on a dynamic LACP trunk you cannot configure the other options that you can on static trunks. If you want to manually configure a trunk, use the trunk command.
VLANs and dynamic LACP

A dynamic LACP trunk operates only in the default VLAN (unless you have enabled GVRP on the switch and use `Forbid` to prevent the ports from joining the default VLAN).

If you want to use LACP for a trunk on a non-default VLAN and GVRP is disabled, configure the trunk as a static trunk.

Blocked ports with older devices

Some older devices are limited to four ports in a trunk. When eight LACP-enabled ports are connected to one of these older devices, four ports connect, but the other four ports are blocked. The LACP status of the blocked ports is shown as "Failure."

If one of the other ports becomes disabled, a blocked port replaces it (Port Status becomes "Up"). When the other port becomes active again, the replacement port goes back to blocked (Port Status is "Blocked"). It can take a few seconds for the switch to discover the current status of the ports.

### Blocked ports with LACP

```bash
switch(eth-B1-B8)# show lacp

<table>
<thead>
<tr>
<th>PORT</th>
<th>LACP</th>
<th>TRUNK</th>
<th>PORT</th>
<th>LACP</th>

</tr>
<tr>
<td>B8</td>
<td>Active</td>
<td>B8</td>
<td>Down</td>
<td>No</td>
<td>Success</td>
</tr>
</tbody>
</table>
```

If there are ports that you do not want on the default VLAN, ensure that they cannot become dynamic LACP trunk members. Otherwise a traffic loop can unexpectedly occur. For Example:

**Figure 15:** A dynamic LACP trunk forming in a VLAN can cause a traffic loop

If the ports in VLAN 2 are configured to allow a dynamic trunk (and GVRP is disabled), adding a second link in VLAN 2 automatically forms a dynamic LACP trunk and moves the trunk to VLAN-1 (the default VLAN), which creates a traffic loop in VLAN 1 between the two switches and eliminates the link in VLAN 2 between the two switches.

Easy control methods include either disabling LACP on the selected ports or configuring them to operate in static LACP trunks.
Spanning Tree and IGMP

If Spanning Tree, IGMP, or both are enabled in the switch, a dynamic LACP trunk operates only with the default settings for these features and does not appear in the port listings for these features.

Half-duplex, different port speeds, or both not allowed in LACP trunks

The ports on both sides of an LACP trunk must be configured for the same speed and for full-duplex (FDx). The 802.3ad LACP standard specifies a full-duplex (FDx) requirement for LACP trunking. (10-gigabit ports operate only at FDx.)

A port configured as LACP passive and not assigned to a port trunk can be configured to half-duplex (HDx). However, in any of the following cases, a port cannot be reconfigured to an HDx setting:

- If the port is a 10-gigabit port.
- If a port is set to LACP Active, you cannot configure it to HDx.
- If a port is already a member of a static or dynamic LACP trunk, you cannot configure it to HDx.
- If a port is already set to HDx, the switch does not allow you to configure it for a static or dynamic LACP trunk.

Dynamic/static LACP interoperation

A port configured for dynamic LACP can properly interoperate with a port configured for static (TrkX) LACP, but any ports configured as standby LACP links are ignored.

Trunk group operation using the "trunk" option

This method creates a trunk group that operates independently of specific trunking protocols and does not use a protocol exchange with the device on the other end of the trunk. With this choice, the switch simply uses the SA/DA method of distributing outbound traffic across the trunked ports without regard for how that traffic is handled by the device at the other end of the trunked links. Similarly, the switch handles incoming traffic from the trunked links as if it were from a trunked source.

When a trunk group is configured with the `trunk` option, the switch automatically sets the trunk to a priority of "4" for Spanning Tree operation (even if Spanning Tree is currently disabled). This appears in the running-config file as `spanning-tree Trkn priority 4`. Executing `write memory` after configuring the trunk places the same entry in the startup-config file.

Use the `trunk` option to establish a trunk group between a switch and another device, where the other device's trunking operation fails to operate properly with LACP trunking configured on the switches.

How the switch lists trunk data

Static trunk group

Appears in the menu interface and the output from the CLI `show trunk` and `show interfaces` commands.

Dynamic LACP trunk group

Appears in the output from the CLI `show lacp` command.
## Outbound traffic distribution across trunked links

The two trunk group options (LACP and trunk) use SA/DA pairs for distributing outbound traffic over trunked links. That is, the switch sends traffic from the same source address to the same destination address through the same trunked link, and may also send traffic from the same source address to a different destination address through the same link or a different link, depending on the mapping of path assignments among the links in the trunk. Likewise, the switch distributes traffic for the same destination address but from different source addresses through links depending on the path assignment.

The load-balancing is done on a per-communication basis. Otherwise, traffic is transmitted across the same path as shown in the figure below. That is, if Client A attached to Switch 1 sends five packets of data to Server A attached to Switch 2, the same link is used to send all five packets. The SA/DA address pair for the traffic is the same. The packets are not evenly distributed across any other existing links between the two switches; they all take the same path.

**Figure 16: Example: of single path traffic through a trunk**

The actual distribution of the traffic through a trunk depends on a calculation using bits from the SA/DA. When an IP address is available, the calculation includes the last five bits of the IP source address and IP destination address; otherwise, the MAC addresses are used. The result of that process undergoes a mapping that determines which link the traffic goes through. If you have only two ports in a trunk, it is possible that all the traffic will be sent through one port even if the SA/DA pairs are different. The more ports you have in the trunk, the more likely it is that the traffic will be distributed among the links.

### Interface option

<table>
<thead>
<tr>
<th>Interface option</th>
<th>Dynamic LACP trunk group</th>
<th>Static LACP trunk group</th>
<th>Static non-protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLI show trunk</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>CLI show interfaces</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>CLI show lACP</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>CLI show spanning-tree</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>CLI show igmp</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>CLI show config</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
When a new port is added to the trunk, the switch begins sending traffic, either new traffic or existing traffic, through the new link. As links are added or deleted, the switch redistributes traffic across the trunk group. For example, in the figure below showing a three-port trunk, traffic could be assigned as shown in the following table.

**Figure 17: Example: of port-trunked network**

![Diagram of port-trunked network](image)

**Table 13: Example: of link assignments in a trunk group (SA/DA distribution)**

<table>
<thead>
<tr>
<th>Source</th>
<th>Destination</th>
<th>Link</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node A</td>
<td>Node W</td>
<td>1</td>
</tr>
<tr>
<td>Node B</td>
<td>Node X</td>
<td>2</td>
</tr>
<tr>
<td>Node C</td>
<td>Node Y</td>
<td>3</td>
</tr>
<tr>
<td>Node D</td>
<td>Node Z</td>
<td>1</td>
</tr>
<tr>
<td>Node A</td>
<td>Node Y</td>
<td>2</td>
</tr>
<tr>
<td>Node B</td>
<td>Node W</td>
<td>3</td>
</tr>
</tbody>
</table>

Because the amount of traffic coming from or going to various nodes in a network can vary widely, it is possible for one link in a trunk group to be fully utilized while other links in the same trunk have unused bandwidth capacity, even if the assignments were evenly distributed across the links in a trunk.

**Trunk load balancing using port layers**

Trunk load balancing using port layers allows the use of TCP/UDP source and destination port number for trunk load balancing. This is in addition to the current use of source and destination IP address and MAC addresses. Configuration of Layer 4 load balancing would apply to all trunks on the switch. Only non-fragmented packets will have their TCP/UDP port number used by load balancing. This ensures that all frames associated with a fragmented IP packet are sent through the same trunk on the same physical link.

The priority for using layer packet information when this feature is enabled is as follows:

**Procedure**

1. **L4-based**: If the packet protocol is an IP packet, use Layer 4, or Layer 3, or Layer 2 information, whichever is present, in that order.
2. **L3-based**: If the packet protocol is an IP packet, use Layer 3, or Layer 2 information, whichever is present, in that order.
3. **L2-based**: If the packet protocol is an IP packet use Layer 2 information.
4. For all options, if the packet is not an IP packet, use Layer 2 information.

**Enabling trunk load balancing**

Enter the following command to enable load balancing.
Syntax:

```
trunk-load-balance L3-based | [L4-based >]
```

This option enables load balancing based on port layer information. The configuration is executed in global configuration context and applies to the entire switch.

Default: L3-based load balancing

<table>
<thead>
<tr>
<th>Layer 2 (L2)</th>
<th>Layer 3 (L3)</th>
<th>Layer 4 (L4)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load balance based on Layer 2 information.</td>
<td>Load balance based on Layer 3 information if present, or Layer 2 information.</td>
<td>Load balance on Layer 4 port information if present, or Layer 3 if present, or Layer 2.</td>
</tr>
</tbody>
</table>

Enabling L4-based trunk load balancing

```
switch(config)# trunk-load-balance L4-based
```

Output when L4-based trunk load balancing is enabled

```
Switch(config)# show trunk

Load Balancing Method: L4-based

<table>
<thead>
<tr>
<th>Port</th>
<th>Name</th>
<th>Type</th>
<th>Group</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>41</td>
<td></td>
<td>100/1000T</td>

Rate-limiting

**CAUTION:** Rate-limiting is intended for use on edge ports in a network. It is not recommended for use on links to other switches, routers, or servers within a network, or for use in the network core. Doing so can interfere with applications the network requires to function properly.

**All traffic rate-limiting**

Rate-limiting for all traffic operates on a per-port basis to allow only the specified bandwidth to be used for inbound or outbound traffic. When traffic exceeds the configured limit, it is dropped. This effectively sets a usage level on a given port and is a tool for enforcing maximum service level commitments granted to network users. This feature operates on a per-port level and is not configurable on port trunks. Rate-limiting is designed to be applied at the network edge to limit traffic from non-critical users or to enforce service agreements such as those offered by Internet Service Providers (ISPs) to provide only the bandwidth for which a customer has paid.

**NOTE:**

Rate-limiting also can be applied by a RADIUS server during an authentication client session. Applying rate-limiting to desirable traffic is **not recommended**. For further details, see "RADIUS Authentication and Accounting" in the access security guide for your switch.

The switches also support ICMP rate-limiting to mitigate the effects of certain ICMP-based attacks. ICMP traffic is necessary for network routing functions. For this reason, blocking all ICMP traffic is not recommended.

**Configuring in/out rate-limiting**

**Syntax:**

```
[no] int <port-list> rate-limit all <in|out> percent <0-100>|kbps <0-100000000>
```

Configures a traffic rate limit (on non-trunked ports) on the link. The `no` form of the command disables rate-limiting on the specified ports.

The `rate-limit all` command controls the rate of traffic sent or received on a port by setting a limit on the bandwidth available. It includes options for:

- Rate-limiting on inbound or outbound traffic.
- Specifying the traffic rate as either a percentage of bandwidth, or in terms of bits per second.

(Defaults: Disabled.)

<table>
<thead>
<tr>
<th><code>in</code> or <code>out</code></th>
<th>Specifies a traffic rate limit on inbound traffic passing through that port or on outbound traffic.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>percent</code> or <code>kbps</code></td>
<td>Specifies the rate limit as a percentage of total available bandwidth, or in kilobits per second.</td>
</tr>
</tbody>
</table>
NOTE:
The granularity of actual limits may vary across different switch models.

For more details on configuring rate-limiting, see All traffic rate-limiting on page 143.

Notes:

- The rate-limit icmp command specifies a rate limit on inbound ICMP traffic only (see ICMP rate-limiting on page 147).
- Rate-limiting does not apply to trunked ports (including meshed ports).
- Kbps rate-limiting is done in segments of 1% of the lowest corresponding media speed. For example, if the media speed is 1 Kbps, the value would be 1 Mbps. A 1-100 Kbps rate-limit is implemented as a limit of 100 Kbps; a limit of 100-199 Kbps is also implemented as a limit of 100 Kbps, a limit of 200-299 Kbps is implemented as a limit of 200 Kbps, and so on.
- Percentage limits are based on link speed. For example, if a 100 Mbps port negotiates a link at 100 Mbps and the inbound rate-limit is configured at 50%, then the traffic flow through that port is limited to no more than 50 Mbps. Similarly, if the same port negotiates a 10 Mbps link, then it allows no more than 5 Mbps of inbound traffic. Configuring a rate limit of 0 (zero) on a port blocks all traffic on that port. However, if this is the desired behavior on the port, Hewlett Packard Enterprise recommends using the <port-list> disable command instead of configuring a rate limit of 0.

You can configure a rate limit from either the global configuration level or from the port context level. For example, either of the following commands configures an inbound rate limit of 60% on ports 3 – 5:

```
switch(config)# int 3-5 rate-limit all in percent 60
switch(eth-3-5)# rate-limit all in percent 60
```

**Displaying the current rate-limit configuration**

The show rate-limit all command displays the per-port rate-limit configuration in the running-config file.

**Syntax:**

```
show rate-limit all [port-list]
```

Without [port-list], this command lists the rate-limit configuration for all ports on the switch.

With [port-list], this command lists the rate-limit configuration for the specified ports. This command operates the same way in any CLI context.

If you want to view the rate-limiting configuration on the first six ports:

**Example:**

Listing the rate-limit configuration on page 144 shows a rate-limiting configuration for the first six ports. In this instance:

- Ports 1–4 are configured with an outbound rate limit of 200 Kbps.
- Port 5 is configured with an inbound rate limit of 20%.
- Port 6 is not configured for rate-limiting.

**Listing the rate-limit configuration**

```
switch# show rate-limit all 1-6
```
<table>
<thead>

</tr>
</tbody>
</table>

NOTE: To view RADIUS-assigned rate-limit information, use one of the following command options:

```
show port-access
  web-based clients <port-list> detailed
  mac-based clients <port-list> detailed
  authenticator clients <port-list> detailed
```

For more on RADIUS-assigned rate-limits, see title "Configuring RADIUS Server Support for Switch Services" in the latest Management and Configuration Guide for your switch.

The `show running` command displays the currently applied setting for any interfaces in the switch configured for all traffic rate-limiting and ICMP rate limiting.

The `show config` command displays this information for the configuration currently stored in the startup-config file. (Note that configuration changes performed with the CLI, but not followed by a write mem command, do not appear in the startup-config file.)

Rate-limit settings listed in the `show config` output

```
switch# show config

```
Operating notes for rate-limiting

- **Rate-limiting operates on a per-port basis, regardless of traffic priority.** Rate-limiting is available on all types of ports (other than trunked ports) and at all port speeds configurable for these switches.

- **Rate-limiting on a trunk is not allowed for the all, bcast, icmp, and mcast traffic types.** Rate-limiting is not supported on ports configured in a trunk group (including mesh ports). Configuring a port for rate-limiting and then adding it to a trunk suspends rate-limiting on the port while it is in the trunk. Attempting to configure rate-limiting on a port that already belongs to a trunk generates the following message:

  `<port-list> : Operation is not allowed for a trunked port.`

- **Rate-limiting and hardware.** The hardware will round the actual Kbps rate down to the nearest multiple of 64 Kbps.

- **Rate-limiting is visible as an outbound forwarding rate.** Because inbound rate-limiting is performed on packets during packet-processing, it is not shown via the inbound drop counters. Instead, this limit is verifiable as the ratio of outbound traffic from an inbound rate-limited port versus the inbound rate. For outbound rate-limiting, the rate is visible as the percentage of available outbound bandwidth (assuming that the amount of requested traffic to be forwarded is larger than the rate-limit).

- **Operation with other features.** Configuring rate-limiting on a port where other features affect port queue behavior (such as flow control) can result in the port not achieving its configured rate-limiting maximum. For example, in a situation where flow control is configured on a rate-limited port, there can be enough "back pressure" to hold high-priority inbound traffic from the upstream device or application to a rate that is lower than the configured rate limit. In this case, the inbound traffic flow does not reach the configured rate and lower priority traffic is not forwarded into the switch fabric from the rate-limited port. (This behavior is termed "head-of-line blocking" and is a well-known problem with flow-control.) In another type of situation, an outbound port can become oversubscribed by traffic received from multiple rate-limited ports. In this case, the actual rate for traffic on the rate-limited ports may be lower than configured because the total traffic load requested to the outbound port exceeds the port's bandwidth, and thus some requested traffic may be held off on inbound.

- **Traffic filters on rate-limited ports.** Configuring a traffic filter on a port does not prevent the switch from including filtered traffic in the bandwidth-use measurement for rate-limiting when it is configured on the same port. For example, ACLs, source-port filters, protocol filters, and multicast filters are all included in bandwidth usage calculations.

- **Monitoring (mirroring) rate-limited interfaces.** If monitoring is configured, packets dropped by rate-limiting on a monitored interface are still forwarded to the designated monitor port. (Monitoring shows what traffic is inbound on an interface, and is not affected by "drop" or "forward" decisions.)

- **Optimum rate-limiting operation.** Optimum rate-limiting occurs with 64-byte packet sizes. Traffic with larger packet sizes can result in performance somewhat below the configured bandwidth. This is to ensure the strictest possible rate-limiting of all sizes of packets.
NOTE: Rate-limiting is applied to the available bandwidth on a port and not to any specific applications running through the port. If the total bandwidth requested by all applications is less than the configured maximum rate, then no rate-limit can be applied. This situation occurs with a number of popular throughput-testing applications, as well as most regular network applications. Consider the following Example: that uses the minimum packet size:

The total available bandwidth on a 100 Mbps port “X” (allowing for Inter-packet Gap—IPG), with no rate-limiting restrictions, is:

\[
(((100,000,000 \text{ bits}) / 8) / 84) \times 64 = 9,523,809 \text{ bytes per second}
\]

where:

- The divisor (84) includes the 12-byte IPG, 8-byte preamble, and 64-bytes of data required to transfer a 64-byte packet on a 100 Mbps link.
- Calculated "bytes-per-second" includes packet headers and data. This value is the maximum "bytes-per-second" that 100 Mbps can support for minimum-sized packets.

Suppose port "X" is configured with a rate limit of 50% (4,761,904 bytes). If a throughput-testing application is the only application using the port and transmits 1 Mbyte of data through the port, it uses only 10.5% of the port's available bandwidth, and the rate-limit of 50% has no effect. This is because the maximum rate permitted (50%) exceeds the test application's bandwidth usage (126,642-164,062 bytes, depending upon packet size, which is only 1.3% to 1.7% of the available total). Before rate-limiting can occur, the test application's bandwidth usage must exceed 50% of the port's total available bandwidth. That is, to test the rate-limit setting, the following must be true:

\[
\text{bandwidth usage} \times (0.50 \times 9,523,809)
\]

**ICMP rate-limiting**

In IP networks, ICMP messages are generated in response to either inquiries or requests from routing and diagnostic functions. These messages are directed to the applications originating the inquiries. In unusual situations, if the messages are generated rapidly with the intent of overloading network circuits, they can threaten network availability. This problem is visible in denial-of-service (DoS) attacks or other malicious behaviors where a worm or virus overloads the network with ICMP messages to an extent where no other traffic can get through. (ICMP messages themselves can also be misused as virus carriers). Such malicious misuses of ICMP can include a high number of ping packets that mimic a valid source IP address and an invalid destination IP address (spoofed pings), and a high number of response messages (such as Destination Unreachable error messages) generated by the network.

ICMP rate-limiting provides a method for limiting the amount of bandwidth that may be used for inbound ICMP traffic on a switch port. This feature allows users to restrict ICMP traffic to percentage levels that permit necessary ICMP functions, but throttle additional traffic that may be caused by worms or viruses (reducing their spread and effect). In addition, ICMP rate-limiting preserves inbound port bandwidth for non-ICMP traffic.

**CAUTION:**

ICMP is necessary for routing, diagnostic, and error responses in an IP network. ICMP rate-limiting is primarily used for throttling worm or virus-like behavior and should normally be configured to allow one to five percent of available inbound bandwidth (at 10 Mbps or 100 Mbps speeds) or 100 to 10,000 kbps (1Gbps or 10 Gbps speeds) to be used for ICMP traffic. This feature should not be used to remove all ICMP traffic from a network.
NOTE:
ICMP rate-limiting does not throttle non-ICMP traffic. In cases where you want to throttle both ICMP traffic and all other inbound traffic on a given interface, you can separately configure both ICMP rate-limiting and all-traffic rate-limiting.

The all-traffic rate-limiting command (rate-limit all) and the ICMP rate-limiting command (rate-limit icmp) operate differently:

- All-traffic rate-limiting applies to both inbound and outbound traffic and can be specified either in terms of a percentage of total bandwidth or in terms of bits per second;
- ICMP rate-limiting applies only to inbound traffic and can be specified as only a percentage of total bandwidth.

Guidelines for configuring ICMP rate-limiting

Apply ICMP rate-limiting on all connected interfaces on the switch to effectively throttle excessive ICMP messaging from any source. Figure 18: Example: of ICMP rate-limiting on page 148 shows an Example: of how to configure this for a small to mid-sized campus though similar rate-limit thresholds are applicable to other network environments. On edge interfaces, where ICMP traffic should be minimal, a threshold of 1% of available bandwidth should be sufficient for most applications. On core interfaces, such as switch-to-switch and switch-to-router, a maximum threshold of 5% should be sufficient for normal ICMP traffic. (*Normal* ICMP traffic levels should be the maximums that occur when the network is rebooting.)

Figure 18: Example: of ICMP rate-limiting

Configuring ICMP rate-limiting

For detailed information about ICMP rate-limiting, see ICMP rate-limiting on page 147.

The rate-limit icmp command controls inbound usage of a port by setting a limit on the bandwidth available for inbound ICMP traffic.

Syntax:

```
[no] int <port-list> rate-limit icmp {< percent < 0-100 > | kbps < 0-10000000 > | [trap-clear]]}
```

Configures inbound ICMP traffic rate-limiting. You can configure a rate limit from either the global configuration level (as shown above) or from the interface context level. The no form of the command disables ICMP rate-limiting on the specified interfaces.
(Default: Disabled.)

<table>
<thead>
<tr>
<th>percent &lt;1-100&gt;</th>
<th>Values in this range allow ICMP traffic as a percentage of the bandwidth available on the interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>kbps &lt;0-10000000&gt;</td>
<td>Specifies the rate at which to forward traffic in kilobits per second.</td>
</tr>
<tr>
<td>0</td>
<td>Causes an interface to drop all incoming ICMP traffic and is not recommended. See the caution.</td>
</tr>
<tr>
<td>trap-clear</td>
<td>Clears existing ICMP rate limiting trap condition.</td>
</tr>
</tbody>
</table>

Note: ICMP rate-limiting is not supported on meshed ports. (Rate-limiting can reduce the efficiency of paths through a mesh domain).

**Example:**

Either of the following commands configures an inbound rate limit of 1% on ports A3 to A5, which are used as network edge ports:

```
switch(config) # int a3-a5 rate-limit icmp 1
switch(eth-A3-A5) # rate-limit icmp 1
```

**NOTE:** When using kbps-mode ICMP rate-limiting, the rate-limiting only operates on the IP payload part of the ICMP packet (as required by metering RFC 2698). This means that effective metering is at a rate greater than the configured rate, with the disparity increasing as the packet size decreases (the packet to payload ratio is higher).

Also, in kbps mode, metering accuracy is limited at low values. For example, less than 45 Kbps. This is to allow metering to function well at higher media speeds such as 10 Gbps.

For information on using ICMP rate-limiting and all-traffic rate-limiting on the same interface, see [Using both ICMP rate-limiting and all-traffic rate-limiting on the same interface](#) on page 149.

### Using both ICMP rate-limiting and all-traffic rate-limiting on the same interface

ICMP and all-traffic rate-limiting can be configured on the same interface. All-traffic rate-limiting applies to all inbound or outbound traffic (including ICMP traffic), while ICMP rate-limiting applies only to inbound ICMP traffic.

**NOTE:** If the all-traffic load on an interface meets or exceeds the currently configured all-traffic inbound rate-limit while the ICMP traffic rate-limit on the same interface has not been reached, all excess traffic is dropped, including any inbound ICMP traffic above the all-traffic limit (regardless of whether the ICMP rate-limit has been reached).

**Example:**

Suppose:

- The all-traffic inbound rate-limit on port "X" is configured at 55% of the port's bandwidth.
- The ICMP traffic rate-limit on port "X" is configured at 2% of the port's bandwidth.

If at a given moment:
• Inbound ICMP traffic on port "X" is using 1% of the port's bandwidth, and
• Inbound traffic of all types on port "X" demands 61% of the port's bandwidth,

all inbound traffic above 55% of the port's bandwidth, including any additional ICMP traffic, is dropped as long as all inbound traffic combined on the port demands 55% or more of the port's bandwidth.

**Viewing the current ICMP rate-limit configuration**

The `show rate-limit icmp` command displays the per-interface ICMP rate-limit configuration in the running-config file.

**Syntax:**

```
show rate-limit icmp [ < port-list > ]
```

Without `[port-list]`, this command lists the ICMP rate-limit configuration for all ports on the switch.

With `[port-list]`, this command lists the rate-limit configuration for the specified interfaces. This command operates the same way in any CLI context.

If you want to view the rate-limiting configuration on ports 1–6:

<table>
<thead>
<tr>
<th>Listing the rate-limit configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)# show rate-limit icmp 1-6</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Port</th>
<th>Mode</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Disabled</td>
<td>Disabled</td>
</tr>
<tr>
<td>2</td>
<td>kbps</td>
<td>100</td>
</tr>
<tr>
<td>3</td>
<td>%</td>
<td>5</td>
</tr>
<tr>
<td>4</td>
<td>%</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>%</td>
<td>1</td>
</tr>
<tr>
<td>6</td>
<td>Disabled</td>
<td>Disable</td>
</tr>
</tbody>
</table>

The `show running` command displays the currently applied setting for any interfaces in the switch configured for all traffic rate-limiting and ICMP rate-limiting.

The `show config` command displays this information for the configuration currently stored in the `startup-config` file. (Note that configuration changes performed with the CLI, but not followed by a `write mem` command, do not appear in the `startup-config` file.)

**Operating notes for ICMP rate-limiting**

ICMP rate-limiting operates on an interface (per-port) basis to allow, on average, the highest expected amount of legitimate, inbound ICMP traffic.

• **Interface support:** ICMP rate-limiting is available on all types of ports (other than trunk ports or mesh ports), and at all port speeds configurable for the switch.

• **Rate-limiting is not permitted on mesh ports:** Either type of rate-limiting (all-traffic or ICMP) can reduce the efficiency of paths through a mesh domain.

• **Rate-limiting on a trunk is not allowed for the all, bcast, icmp, and mcast traffic types.** Neither all-traffic nor ICMP rate-limiting are supported on ports configured in a trunk group.
ICMP percentage-based rate-limits are calculated as a percentage of the negotiated link speed: For example, if a 100 Mbps port negotiates a link to another switch at 100 Mbps and is ICMP rate-limit configured at 5%, the inbound ICMP traffic flow through that port is limited to 5 Mbps. Similarly, if the same port negotiates a 10 Mbps link, it allows 0.5 Mbps of inbound traffic. If an interface experiences an inbound flow of ICMP traffic in excess of its configured limit, the switch generates a log message and an SNMP trap (if an SNMP trap receiver is configured).

ICMP rate-limiting is port-based: ICMP rate-limiting reflects the available percentage of an interface’s entire inbound bandwidth. The rate of inbound flow for traffic of a given priority and the rate of flow from an ICMP rate-limited interface to a particular queue of an outbound interface are not measures of the actual ICMP rate limit enforced on an interface.

Below-maximum rates: ICMP rate-limiting operates on a per-interface basis, regardless of traffic priority. Configuring ICMP rate-limiting on an interface where other features affect inbound port queue behavior (such as flow control) can result in the interface not achieving its configured ICMP rate-limiting maximum. For example, in some situations with flow control configured on an ICMP rate-limited interface, there can be enough “back pressure” to hold high-priority inbound traffic from the upstream device or application to a rate that does not allow bandwidth for lower-priority ICMP traffic. In this case, the inbound traffic flow may not permit the forwarding of ICMP traffic into the switch fabric from the rate-limited interface. (This behavior is termed “head-of-line blocking” and is a well-known problem with flow-control.) In cases where both types of rate-limiting (rate-limit all and rate-limit icmp) are configured on the same interface, this situation is more likely to occur.

In another type of situation, an outbound interface can become oversubscribed by traffic received from multiple ICMP rate-limited interfaces. In this case, the actual rate for traffic on the rate-limited interfaces may be lower than configured because the total traffic load requested to the outbound interface exceeds the interface’s bandwidth, and thus some requested traffic may be held off on inbound.

Monitoring (mirroring) ICMP rate-limited interfaces: If monitoring is configured, packets dropped by ICMP rate-limiting on a monitored interface are still forwarded to the designated monitor port. (Monitoring shows what traffic is inbound on an interface, and is not affected by "drop" or "forward" decisions.)

Optimum rate-limiting operation: Optimum rate-limiting occurs with 64-byte packet sizes. Traffic with larger packet sizes can result in performance somewhat below the configured inbound bandwidth. This is to ensure the strictest possible rate-limiting of all sizes of packets.

Outbound traffic flow: Configuring ICMP rate-limiting on an interface does not control the rate of outbound traffic flow on the interface.

ICMP rate-limiting trap and Event Log messages

If the switch detects a volume of inbound ICMP traffic on a port that exceeds the ICMP rate-limit configured for that port, it generates one SNMP trap and one informational Event Log message to notify the system operator of the condition. (The trap and Event Log message are sent within two minutes of when the event occurred on the port.) For Example:

```
I 06/30/05 11:15:42 RateLim: ICMP traffic exceeded configured limit on port A1
```

These trap and Event Log messages provide an advisory that inbound ICMP traffic on a given interface has exceeded the configured maximum. The additional ICMP traffic is dropped, but the excess condition may indicate an infected host (or other traffic threat or network problem) on that interface. The system operator should investigate the attached devices or network conditions further; the switch does not send more traps or Event Log messages for excess ICMP traffic on the affected port until the system operator resets the port's ICMP trap function.

The switch does not send more traps or Event Log messages for excess ICMP traffic on the affected port until the system operator resets the port’s ICMP trap function. The reset can be done through SNMP from a network management station or through the CLI with the `trap-clear` command option.
Syntax:

```
interface <port-list> rate-limit icmp trap-clear
```

On a port configured with ICMP rate-limiting, this command resets the ICMP trap function, which allows the switch to generate a new SNMP trap and an Event Log message if ICMP traffic in excess of the configured limit is detected on the port.

**Example:**

An operator noticing an ICMP rate-limiting trap or Event Log message originating with port 1 on a switch would use the following command to reset the port to send a new message if the condition occurs again:

```
Switch(config)# interface 1 rate-limit icmp trap-clear
```

**Determining the switch port number used in ICMP port reset commands**

To enable excess ICMP traffic notification traps and Event Log messages, use the `setmib` command described on [ICMP rate-limiting trap and Event Log messages](#) on page 151. The port number included in the command corresponds to the internal number the switch maintains for the designated port and not the port's external identity.

To match the port's external slot/number to the internal port number, use the `walkmib ifDescr` command, as shown in the following example:

```
Matching internal port numbers to external port numbers
```

```
switch# walkmib ifDescr
ifDescr.1 = 1
ifDescr.2 = 2
ifDescr.3 = 3
ifDescr.4 = 4
ifDescr.5 = 5
ifDescr.6 = 6
ifDescr.7 = 7
ifDescr.8 = 8
ifDescr.9 = 9
ifDescr.10 = 10
ifDescr.11 = 11
ifDescr.12 = 12
ifDescr.13 = 13
ifDescr.14 = 14
ifDescr.15 = 15
ifDescr.16 = 16
ifDescr.17 = 17
ifDescr.18 = 18
ifDescr.19 = 19
ifDescr.20 = 20
ifDescr.21 = 21
ifDescr.22 = 22
ifDescr.23 = 23
ifDescr.24 = 24
ifDescr.210 = Trk1
ifDescr.211 = Trk2
ifDescr.330 = DEFAULT_VLAN
ifDescr.4425 = Switch software loopback interface
ifDescr.4426 = Switch software loopback interface
```
Configuring inbound rate-limiting for broadcast and multicast traffic

You can configure rate-limiting (throttling) of inbound broadcast and multicast traffic on the switch, which helps prevent the switch from being disrupted by traffic storms if they occur on the rate-limited port. The rate-limiting is implemented as a percentage of the total available bandwidth on the port.

The rate-limit command can be executed from the global or interface context, for Example:

```
switch(config)# interface 3 rate-limit bcast in percent 10
```

or

```
switch(config)# interface 3
switch(eth-3)# rate-limit bcast in percent 10
```

**Syntax:**

```
rate-limit {< bcast | mcast >} in percent <0-100>
```

**Option**

*in percent <0-100>*

Also supports configuring limit in kbps

```
[no] rate-limit {<bcast | [mcast >]} in
```

Enables rate-limiting and sets limits for the specified inbound broadcast or multicast traffic. Only the amount of traffic specified by the percent is forwarded.

**Default:** Disabled

If you want to set a limit of 50% on inbound broadcast traffic for port 3, you can first enter interface context for port 3 and then execute the rate-limit command, as shown in Inbound broadcast rate-limiting of 50% on port 3 on page 153. Only 50% of the inbound broadcast traffic will be forwarded.

### Inbound broadcast rate-limiting of 50% on port 3

```
switch(config)# int 3
switch(eth-3)# rate-limit bcast in percent 50
```

```
switch(eth-3)# show rate-limit bcast
Broadcast-Traffic Rate Limit Maximum %

<table>
<thead>
<tr>
<th>Port</th>
<th>Inbound Limit</th>
<th>Mode</th>
<th>Radius Override</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Disabled</td>
<td>Disabled</td>
<td>No-override</td>
</tr>
<tr>
<td>2</td>
<td>Disabled</td>
<td>Disabled</td>
<td>No-override</td>
</tr>
<tr>
<td>3</td>
<td>Disabled</td>
<td>%</td>
<td>No-override</td>
</tr>
<tr>
<td>4</td>
<td>Disabled</td>
<td>Disabled</td>
<td>No-override</td>
</tr>
<tr>
<td>5</td>
<td>Disabled</td>
<td>Disabled</td>
<td>No-override</td>
</tr>
</tbody>
</table>
```

If you rate-limit multicast traffic on the same port, the multicast limit is also in effect for that port, as shown in Inbound multicast rate-limiting of 20% on port 3 on page 154. Only 20% of the multicast traffic will be forwarded.
Inbound multicast rate-limiting of 20% on port 3

```bash
switch(eth-3)# rate-limit mcast in percent 20
switch(eth-3)# show rate-limit mcast
```

Multicast-Traffic Rate Limit Maximum %

<table>
<thead>
<tr>
<th>Port</th>
<th>Inbound Limit Mode</th>
<th>Radius Override</th>
</tr>
</thead>
<tbody>
<tr>

Operating Notes

The following information is displayed for each installed transceiver:

- Port number on which transceiver is installed.
- Type of transceiver.
- Product number — Includes revision letter, such as A, B, or C. If no revision letter follows a product number, this means that no revision is available for the transceiver.
- Part number — Allows you to determine the manufacturer for a specified transceiver and revision number.
- For a non-Aruba switches installed transceiver (see line 23 of "The show tech transceivers command" example), no transceiver type, product number, or part information is displayed. In the Serial Number field, non-operational is displayed instead of a serial number.
- The following error messages may be displayed for a non-operational transceiver:
  - Unsupported Transceiver. (SelfTest Err#060)
  - This switch only supports revision B and above transceivers.
  - Self test failure.
  - Transceiver type not supported in this port.
Transceiver type not supported in this software version.

Not an Switch Transceiver.

**Guaranteed minimum bandwidth (GMB)**

GMB provides a method for ensuring that each of a given port's outbound traffic priority queues has a specified minimum consideration for sending traffic out on the link to another device. This can prevent a condition where applications generating lower-priority traffic in the network are frequently or continually "starved" by high volumes of higher-priority traffic. You can configure GMB per-port and, in the case of the 2920 and 5400R switches, per static trunk.

**GMB operation**

NOTE: Earlier software releases supported GMB configuration on a per-port basis. Beginning with software release 15.18, the 2920 and 5400R switches also support GMB configuration on static trunks. (GMB configuration is not supported on dynamic LACP or distributed (DT) trunks.

For application to static trunk interfaces (2920 and 5400r only), GMB enforcement is applied individually to each port belonging to the trunk, and not to the trunk as a whole.

For any port, group of ports or, static trunks, you can use the default minimum bandwidth settings for each outbound priority queue or a customized bandwidth profile. It is also possible to disable the feature entirely.

The switch services per-port outbound traffic in a descending order of priority; that is, from the highest priority to the lowest priority. By default, each port (including each port in a static trunk) offers eight prioritized, outbound traffic queues. Tagged VLAN traffic is prioritized according to the 802.1p priority the traffic carries. Untagged VLAN traffic is assigned a priority of 0 (normal).

<table>
<thead>
<tr>
<th>802.1p Priority settings in tagged VLAN packets¹</th>
<th>Outbound priority queue for a given port</th>
</tr>
</thead>
<tbody>

<td>7</td>
</tr>
<tr>
<td>7 (high)</td>
<td>8</td>
</tr>
</tbody>
</table>

¹ The switch processes outbound traffic from an untagged port at the "0" (normal) priority level.

You can use GMB to reserve a specific percentage of each port’s available outbound bandwidth for each of the eight priority queues. This means that regardless of the amount of high-priority outbound traffic on a port (including each port in a static trunk), you can ensure that there will always be bandwidth reserved for lower-priority traffic.
Since the switch services outbound traffic according to priority (highest to lowest), the highest-priority outbound traffic on a given port automatically receives the first priority in servicing. Thus, in most applications, it is necessary only to specify the minimum bandwidth you want to allocate to the lower priority queues. In this case, the high-priority traffic automatically receives all unassigned bandwidth without starving the lower-priority queues.

Conversely, configuring a bandwidth minimum on only the high-priority outbound queue of a port or static trunk (and not providing a bandwidth minimum for the lower-priority queues) is not recommended, because it may "starve" the lower-priority queues.

**NOTE:** For a given port, when the demand on one or more outbound queues exceeds the minimum bandwidth configured for those queues, the switch apports unallocated bandwidth to these queues on a priority basis. As a result, specifying a minimum bandwidth for a high-priority queue but not specifying a minimum for lower-priority queues can starve the lower-priority queues during periods of high demand on the high priority queue. For example, if a port or static trunk configured to allocate a minimum bandwidth of 80% for outbound high-priority traffic experiences a demand above this minimum, this burst starves lower-priority queues that do not have a minimum configured. Normally, this will not altogether halt lower priority traffic on the network, but will likely cause delays in the delivery of the lower-priority traffic.

The sum of the GMB settings for all outbound queues on a given port or static trunk cannot exceed 100%.

**Impacts of QoS queue configuration on GMB operation**

The section Configuring GMB for outbound traffic on page 157 assumes the ports on the switch offer eight prioritized, outbound traffic queues. This may not always be the case, however, because the switch supports a QoS queue configuration feature that allows you to reduce the number of outbound queues from eight (the default) to four queues, or two.

Changing the number of queues affects the GMB commands (interface bandwidth-min and show bandwidth output) such that they operate only on the number of queues currently configured. If the queues are reconfigured, the guaranteed minimum bandwidth per queue is automatically re-allocated according to the following percentages:

**Table 15: Default GMB percentage allocations per QoS queue configuration**

<table>

</tbody>
</table>

**NOTE:** For more information on queue configuration and the associated default minimum bandwidth settings, see the "Quality of Service (QoS): managing bandwidth more effectively" in the advanced traffic management guide for your switch.
Configuring GMB for outbound traffic

For any port, group of ports, or static trunk, you can configure either the default minimum bandwidth settings for each outbound priority queue or a customized bandwidth allocation. For most applications, Hewlett Packard Enterprise recommends configuring GMB with the same values on all ports on the switch so that the outbound traffic profile is consistent for all outbound traffic. However, there may be instances where it may be advantageous to configure special profiles on connections to servers or to the network infrastructure (such as links to routers, other switches, or to the network core).

Syntax:

```
[no] int <port-list|trk_#> bandwidth-min output
```

Configures the default minimum bandwidth allocation for the outbound priority queue for each port or static trunk in the `<port-list|trk_#>`. In the eight-queue configuration, the default values per priority queue are:

- Queue 1 (low priority): 2%
- Queue 2 (low priority): 3%
- Queue 3 (normal priority): 30%
- Queue 4 (normal priority): 10%
- Queue 5 (medium priority): 10%
- Queue 6 (medium priority): 10%
- Queue 7 (high priority): 15%
- Queue 8 (high priority): 20%

The `no` form of the command disables GMB for all ports and trunks in the `<port-list>` . In this state, which is the equivalent of setting all outbound queues on a port or static trunk to 0 (zero), a high level of higher-priority traffic can starve lower-priority queues, which can slow or halt lower-priority traffic in the network.

You can configure bandwidth minimums from either the global configuration level (as shown above) or from the port or static trunk context level. For information on outbound port queues, see Per-port outbound priority queues.

Syntax:

```
[no] int <port-list|trk_#>> bandwidth-min output [0-100|strict] [0-100]
```

Select a minimum bandwidth.

For ports and trunks in `<port-list|trk_#>` , specifies the minimum outbound bandwidth as a percent of the total bandwidth for each outbound queue. The queues receive service in descending order of priority of each port.

NOTE: For application to static trunk interfaces (2920 and 5400R only), GMB enforcement is applied individually to each port belonging to the trunk, and not to the trunk as a whole.

You must specify a bandwidth percent value for all except the highest priority queue, which may instead be set to "strict" mode. The sum of the bandwidth percentages below the top queue cannot exceed 100%. (0 is a value for a queue percentage setting.)

Configuring a total of less than 100% across the eight queues results in unallocated bandwidth that remains harmlessly unused unless a given queue becomes oversubscribed. In this case, the unallocated bandwidth is apportioned to oversubscribed queues in descending order of priority. For example, if you configure a minimum of 10% for queues 1 to 7 and 0% for queue 8, the unallocated bandwidth is available to all eight queues in the following prioritized order:
Queue 8 (high priority)
Queue 7 (high priority)
Queue 6 (medium priority)
Queue 5 (medium priority)
Queue 4 (normal priority)
Queue 3 (normal priority)
Queue 2 (low priority)
Queue 1 (low priority)

A setting of 0 (zero percent) on a queue means that no bandwidth minimum is specifically reserved for that queue for each of the ports (including trunked ports) in the <port-list|trk_#>.

Also, there is no benefit to setting the high-priority queue (queue 8) to 0 (zero) unless you want the medium queue (queues 5 and 6) to be able to support traffic bursts above its guaranteed minimum.

[strict]: Provides the ability to configure the highest priority queue as strict. Per-queue values must be specified in priority order, with queue 1 having the lowest priority and queue 8 (or 4, or 2) having the highest priority (the highest queue is determined by how many queues are configured on the switch. Two, four, and eight queues are permitted (see the qos queue-config command). The strict queue is provided all the bandwidth it needs. Any remaining bandwidth is shared among the non-strict queues based on need and configured bandwidth profiles (the profiles are applied to the leftover bandwidth in this case). The total sum of percentages for non-strict queues must not exceed 100.

NOTE: Configuring 0% for a queue can result in that queue being starved if any higher queue becomes over-subscribed and is then given all unused bandwidth.

The switch applies the bandwidth calculation to the link speed the port or trunk is currently using. For example, if a 10/100 Mbs port negotiates to 10 Mbps on the link, it bases its GMB calculations on 10 Mbps, not 100 Mbps.

Use show bandwidth output <<port-list|trk_#>> to display the current GMB configuration. (The show config and show running commands do not include GMB configuration data.)

Example:

For example, suppose you want to configure the following outbound minimum bandwidth availability for ports 1 and 2:

<table>
<thead>
<tr>
<th>Priority of outbound port queue</th>
<th>Minimum bandwidth %</th>
<th>Effect on outbound bandwidth allocation</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>20%</td>
<td>Queue 8 has the first priority use of all outbound bandwidth not specifically allocated to queues 1 to 7.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If, for example, bandwidth allocated to queue 5 is not being used and queues 7 and 8 become oversubscribed, queue 8 has first-priority use of the unused bandwidth allocated to queue 5.</td>
</tr>
<tr>
<td>7</td>
<td>15%</td>
<td>Queue 7 has a GMB of 15% available for outbound traffic. If queue 7 becomes oversubscribed and queue 8 is not already using all of the unallocated bandwidth, queue 7 can use the unallocated bandwidth.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Also, any unused bandwidth allocated to queues 6 to queue 1 is available to queue 7 if queue 8 has not already claimed it.</td>
</tr>
</tbody>
</table>

Table Continued
<table>
<thead>
<tr>
<th>Priority of outbound port queue</th>
<th>Minimum bandwidth %</th>
<th>Effect on outbound bandwidth allocation</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>10%</td>
<td>Queue 6 has a GMB of 10% and, if oversubscribed, is subordinate to queues 8 and 7 in priority for any unused outbound bandwidth available on the port.</td>
</tr>
<tr>
<td>5</td>
<td>10%</td>
<td>Queue 5 has a GMB of 10% and, if oversubscribed, is subordinate to queues 8, 7, and 6 for any unused outbound bandwidth available on the port.</td>
</tr>
<tr>
<td>4</td>
<td>10%</td>
<td>Queue 4 has a GMB of 10% and, if oversubscribed, is subordinate to queues, 8, 7, 6, and 5 for any unused outbound bandwidth available on the port.</td>
</tr>
<tr>
<td>3</td>
<td>30%</td>
<td>Queue 3 has a GMB of 30% and, if oversubscribed, is subordinate to queues, 8, 7, 6, 5, and 4 for any unused outbound bandwidth available on the port.</td>
</tr>
<tr>
<td>2</td>
<td>3%</td>
<td>Queue 2 has a GMB of 3% and, if oversubscribed, is subordinate to queues, 8, 7, 6, 5, 4, and 3 for any unused outbound bandwidth available on the port.</td>
</tr>
<tr>
<td>1</td>
<td>2%</td>
<td>Queue 1 has a GMB of 2% and, if oversubscribed, is subordinate to all the other queues for any unused outbound bandwidth available on the port.</td>
</tr>
</tbody>
</table>

Either of the following commands configures ports 1 through 5 with bandwidth settings:

Switch(config) # int 1-5 bandwidth-min output 2 3 30 10 10 10 15 strict
Switch(interface 1-5) # bandwidth-min output 2 3 30 10 10 10 15 strict

**Viewing the current GMB configuration**

This command displays the per-port GMB configuration in the running-config file.

**Syntax:**

```
show bandwidth output <port-list|trk_#>
```

Without `<port-list|trk_#>`, this command lists the GMB configuration for all ports and static trunks on the switch.

With `<port-list|trk_#>`, this command lists the GMB configuration for the specified ports and static trunks.

This command operates the same way in any CLI context. If the command lists Disabled for a port or trunk, there are no bandwidth minimums configured for any queue on the port or trunk. (See the description of the no form of the bandwidth-min output command.)

**Listing the GMB configuration** on page 159 displays the GMB configuration resulting from either of the above commands.

**Listing the GMB configuration**

```
switch(config)# show bandwidth output 1-5, trk1
Outbound Guaranteed Minimum Bandwidth %
```
GMB operating notes

Impact of QoS queue configuration on GMB commands

Changing the number of queues causes the GMB commands (interface bandwidth-min and show bandwidth output) to operate only on the number of queues currently configured. In addition, when the qos queue-config command is executed, any previously configured bandwidth-min output settings are removed from the startup configuration. For the default GMB percentage allocations per number of queues, see Default GMB percentage allocations per QoS queue configuration.

Rate-limiting Unknown Unicast Traffic

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. The switch floods the unicast packets to all interfaces that are members of the VLAN. An attacker can bring down the network by sending out packets to random destination MAC addresses and hence it is important to rate limit traffic with unknown destination addresses.

You can rate limit the unknown unicast traffic per port level in either percent or kbps mode.

**rate-limit unknown-unicast in percent**

**Syntax**

interface port-list rate-limit unknown-unicast in percent 0-100

**Description**

Sets a rate limit for incoming unicast flood traffic.

**Command context**

interface

**Parameters**

in

Sets a rate limit for incoming unicast flood traffic.

percent

Specifies the rate limit as a percentage of the total available bandwidth.

kbps

Specifies the rate limit in Kb/s.

**Examples**

switch(config)# int 2
switch(eth-2)# rate-limit
all Set a rate limit for all traffic.
bcast Set a rate limit for broadcast traffic.
icmp Set a rate limit for ICMP traffic.
mcast               Set a rate limit for multicast traffic.
queues              Set a rate limit for each traffic queue.
unknown-unicast     Set a rate limit for unicast flood traffic.

switch(eth-2)# rate-limit unknown-unicast
in                  Set a rate limit for incoming unicast flood traffic.
switch(eth-2)# rate-limit unknown-unicast in
kbps
percent             switch(eth-2)# rate-limit unknown-unicast in percent 10
switch(eth-2)# show rate-limit

Unknown-Unicast Traffic Rate Limit Maximum %

<table>
<thead>
<tr>
<th>Port</th>
<th>Inbound Limit Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>10</td>
</tr>
</tbody>
</table>

rate-limit unknown-unicast in kbps

Syntax

interface port-list rate-limit unknown-unicast in kbps rate

Description

Sets a rate limit for unicast flood traffic.

Command context

interface

Parameters

in

Sets a rate limit for incoming unicast flood traffic.

percent

Specifies the rate limit as a percentage of the total available bandwidth.

kbps

Specifies the rate limit in Kb/s.

Examples

switch(config)# int 1
switch(eth-1)# rate-limit
all          Set a rate limit for all traffic.
bcast        Set a rate limit for broadcast traffic.
icmp         Set a rate limit for ICMP traffic.
mcast        Set a rate limit for multicast traffic.
queues       Set a rate limit for each traffic queue.
unknown-unicast Set a rate limit for unicast flood traffic.
```
switch(eth-1)# rate-limit unknown-unicast
               Set a rate limit for incoming unicast flood traffic.
switch(eth-1)# rate-limit unknown-unicast in
kbps
percent
switch(eth-1)# rate-limit unknown-unicast in kbps 100
switch(eth-1)# show rate-limit
all                   Show total traffic rate limits.
bcast                 Show broadcast traffic rate limits.
icmp                  Show ICMP traffic rate limits.
mcast                 Show multicast traffic rate limits.
queues                Show limits for outgoing queue traffic.
unknown-unicast       Show unicast flood traffic rate limits.
switch(eth-1)# show rate-limit unknown-unicast

Unknown-Unicast Traffic Rate Limit Maximum %

Jumbo frames

The maximum transmission unit (MTU) is the maximum size IP frame the switch can receive for Layer 2 frames inbound on a port. The switch drops any inbound frames larger than the MTU allowed on the port. Ports operating at a minimum of 1 Gbps can accept forward frames of up to 9220 bytes (including four bytes for a VLAN tag) when configured for jumbo traffic. You can enable inbound jumbo frames on a per-VLAN basis. That is, on a VLAN configured for jumbo traffic, all ports belonging to that VLAN and operating at a minimum of 1 Gbps allow inbound jumbo frames of up to 9220 bytes.

Operating rules

- **Required port speed**: This feature allows inbound and outbound jumbo frames on ports operating at a minimum of 1 Gbps.
- **GVRP operation**: A VLAN enabled for jumbo traffic cannot be used to create a dynamic VLAN. A port belonging to a statically configured, jumbo-enabled VLAN cannot join a dynamic VLAN.
- **Port adds and moves**: If you add a port to a VLAN that is already configured for jumbo traffic, the switch enables that port to receive jumbo traffic. If you remove a port from a jumbo-enabled VLAN, the switch disables jumbo traffic capability on the port only if the port is not currently a member of another jumbo-enabled VLAN. This same operation applies to port trunks.
- **Jumbo traffic sources**: A port belonging to a jumbo-enabled VLAN can receive inbound jumbo frames through any VLAN to which it belongs, including non-jumbo VLANs. For example, if VLAN 10 (without jumbos enabled) and VLAN 20 (with jumbos enabled) are both configured on a switch, and port 1 belongs to both VLANs, port 1 can receive jumbo traffic from devices on either VLAN. For a method to allow only some ports in a VLAN to receive jumbo traffic, see **Configuring a maximum frame size** on page 167.

Jumbo traffic-handling

- Configuring a voice VLAN to accept jumbo frames is not recommended. Voice VLAN frames are typically small, and allowing a voice VLAN to accept jumbo frame traffic can degrade the voice transmission performance.
- You can configure the default, primary, and/or (if configured) the management VLAN to accept jumbo frames on all ports belonging to the VLAN.
- When the switch applies the default MTU (1522-bytes including 4 bytes for the VLAN tag) to a VLAN, all ports in the VLAN can receive incoming frames of up to 1522 bytes. When the switch applies the jumbo MTU (9220 bytes including 4 bytes for the VLAN tag) to a VLAN, all ports in that VLAN can receive incoming frames of up to 9220 bytes.

<td>Disabled</td>
</tr>
</tbody>
</table>
A port receiving frames exceeding the applicable MTU drops such frames, causing the switch to generate an Event Log message and increment the "Giant Rx" counter (displayed by show interfaces <port-list> ).

- The switch allows flow control and jumbo frame capability to co-exist on a port.
- The default MTU is 1522 bytes (including 4 bytes for the VLAN tag). The jumbo MTU is 9220 bytes (including 4 bytes for the VLAN tag).
- When a port is not a member of any jumbo-enabled VLAN, it drops all jumbo traffic. If the port is receiving "excessive"inbound jumbo traffic, the port generates an Event Log message to notify you of this condition. This same condition also increments the switch's "Giant Rx" counter.
- If you do not want all ports in a given VLAN to accept jumbo frames, you can consider creating one or more jumbo VLANs with a membership comprising only the ports you want to receive jumbo traffic. Because a port belonging to one jumbo-enabled VLAN can receive jumbo frames through any VLAN to which it belongs, this method enables you to include both jumbo-enabled and non-jumbo ports within the same VLAN.

For example, suppose you want to allow inbound jumbo frames only on ports 6, 7, 12, and 13. However, these ports are spread across VLAN 100 and VLAN 200 and also share these VLANs with other ports you want excluded from jumbo traffic. A solution is to create a third VLAN with the sole purpose of enabling jumbo traffic on the desired ports, while leaving the other ports on the switch disabled for jumbo traffic. That is:

<table>
<thead>
<tr>
<th>VLAN 100</th>
<th>VLAN 200</th>
<th>VLAN 300</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ports</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6-10</td>
<td>11-15</td>
<td>6, 7, 12, and 13</td>
</tr>
<tr>
<td>Jumbo-enabled?</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

If there are security concerns with grouping the ports as shown for VLAN 300, you can either use source-port filtering to block unwanted traffic paths or create separate jumbo VLANs, one for ports 6 and 7, and another for ports 12 and 13.

- **Outbound jumbo traffic.** Any port operating at 1 Gbps or higher can transmit outbound jumbo frames through any VLAN, regardless of the jumbo configuration. The VLAN is not required to be jumbo-enabled, and the port is not required to belong to any other, jumbo-enabled VLANs. This can occur in situations where a non-jumbo VLAN includes some ports that do not belong to another, jumbo-enabled VLAN and some ports that do belong to another, jumbo-enabled VLAN. In this case, ports capable of receiving jumbo frames can forward them to the ports in the VLAN that do not have jumbo capability, as shown in Figure 19: Forwarding jumbo frames through non-jumbo ports on page 164.

**Figure 19: Forwarding jumbo frames through non-jumbo ports**

![Diagram showing jumbo frames forward through non-jumbo ports](image)

Jumbo frames can also be forwarded out non-jumbo ports when the jumbo frames received inbound on a jumbo-enabled VLAN are routed to another, non-jumbo VLAN for outbound transmission on ports that have no memberships in other, jumbo-capable VLANs. Where either of the above scenarios is a possibility, the
downstream device must be configured to accept the jumbo traffic. Otherwise, this traffic will be dropped by the downstream device.

# Configuring jumbo frame operation

For detailed information about jumbo frames, see [Jumbo frames](#) on page 163.

## Overview

1. Determine the VLAN membership of the ports or trunks through which you want the switch to accept inbound jumbo traffic. For operation with GVRP enabled, refer to the GVRP topic under "Operating Rules", above.

2. Ensure that the ports through which you want the switch to receive jumbo frames are operating at least at gigabit speed. (Check the Mode field in the output for the `show interfaces brief <port-list>` command.)

3. Use the `jumbo` command to enable jumbo frames on one or more VLANs statically configured in the switch. (All ports belonging to a jumbo-enabled VLAN can receive jumbo frames.

4. Execute `write memory` to save your configuration changes to the `startupconfig` file.

## Viewing the current jumbo configuration

**Syntax:**

```
show vlans
```

Lists the static VLANs configured on the switch and includes a Jumbo column to indicate which VLANs are configured to support inbound jumbo traffic. All ports belonging to a jumbo-enabled VLAN can receive jumbo traffic. (For more information, see [Configuring a maximum frame size](#) on page 167.) See Figure **Figure 20: Example: listing of static VLANs to show jumbo status per VLAN** on page 165.

**Figure 20: Example: listing of static VLANs to show jumbo status per VLAN**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Name</th>
<th>Status</th>
<th>Voice</th>
<th>Jumbo</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DEFAULT_VLAN</td>
<td>Port-based</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>5</td>
<td>VLAN5</td>
<td>Port-based</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>22</td>
<td>VLAN22</td>
<td>Port-based</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Syntax:**

```
show vlans ports <port-list>
```

Lists the static VLANs to which the specified ports belong, including the Jumbo column to indicate which VLANs are configured to support jumbo traffic.

Entering only one port in `<port-list>` results in a list of all VLANs to which that port belongs.

Entering multiple ports in `<port-list>` results in a superset list that includes the VLAN memberships of all ports in the list, even though the individual ports in the list may belong to different subsets of the complete VLAN listing.

**Example:**
If port 1 belongs to VLAN 1, port 2 belongs to VLAN 10, and port 3 belongs to VLAN 15, executing this command with a port-list of 1 - 3 results in a listing of all three VLANs, even though none of the ports belong to all three VLANs. (See Figure 21: Listing the VLAN memberships for a range of ports on page 166.)

**Figure 21: Listing the VLAN memberships for a range of ports**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Name</th>
<th>Status</th>
<th>Voice</th>
<th>Jumbo</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DEFAULT_VLAN</td>
<td>Port-based</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>10</td>
<td>VLAN10</td>
<td>Port-based</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>15</td>
<td>VLAN15</td>
<td>Port-based</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

Syntax:

```
show vlans <vid>
```

Shows port membership and jumbo configuration for the specified vid. (See Figure 22: Example: of listing the port membership and jumbo status for a VLAN on page 166.)

**Figure 22: Example: of listing the port membership and jumbo status for a VLAN**

Enabling or disabling jumbo traffic on a VLAN

Syntax:

```
vlan <vid> jumbo
```

[no] vlan <vid> jumbo

Configures the specified VLAN to allow jumbo frames on all ports on the switch that belong to that VLAN. If the VLAN is not already configured on the switch, `vlan <vid> jumbo` also creates the VLAN.

A port belonging to one jumbo VLAN can receive jumbo frames through any other VLAN statically configured on the switch, regardless of whether the other VLAN is enabled for jumbo frames.

The [no] form of the command disables inbound jumbo traffic on all ports in the specified VLAN that do not also belong to another VLAN that is enabled for jumbo traffic. In a VLAN context, the command forms are jumbo and no jumbo.

(Defaults: Jumbos disabled on the specified VLAN.)
Configuring a maximum frame size

You can globally set a maximum frame size for jumbo frames that will support values from 1518 bytes to 9216 bytes for untagged frames.

Syntax:

```
jumbo max-frame-size <size>
```

Sets the maximum frame size for jumbo frames. The range is from 1518 bytes to 9216 bytes. (Default: 9216 bytes)

**NOTE:**

The jumbo max-frame-size is set on a GLOBAL level.

Default: 9216 bytes

Configuring IP MTU

**NOTE:**

The following feature is available on the switches covered in this guide. jumbos support is required for this feature. On switches that do not support this command, the IP MTU value is derived from the maximum frame size and is not configurable.

You can set the IP MTU globally by entering this command. The value of max-frame-size must be greater than or equal to 18 bytes more than the value selected for ip-mtu. For example, if ip-mtu is set to 8964, the max-frame-size is configured as 8982.

Syntax:

```
jumbo ip-mtu <size>
```

Globally sets the IP MTU size. Values range between 1500 and 9198 bytes. This value must be 18 bytes less than the value of max-frame-size.

(Default: 9198 bytes)

**SNMP implementation**

**Jumbo maximum frame size**

The maximum frame size for jumbos is supported with the following proprietary MIB object:

```
hpSwitchMaxFrameSize OBJECT-TYPE
```

This is the value of the global max-frame-size supported by the switch. The default value is set to 9216 bytes.

**Jumbo IP MTU**

The IP MTU for jumbos is supported with the following proprietary MIB object:

```
hpSwitchIpMTU OBJECT-TYPE
```

This is the value of the global jumbos IP MTU (or L3 MTU) supported by the switch. The default value is set to 9198 bytes (a value that is 18 bytes less than the largest possible maximum frame size of 9216 bytes). This object can be used only in switches that support max-frame-size and ip-mtu configuration.

**Displaying the maximum frame size**

Use the show jumbos command to display the globally configured untagged maximum frame size for the switch, as shown in the following Example:
switch(config)# show jumbos

Jumbos Global Values

<table>
<thead>
<tr>
<th>Configured</th>
<th>MaxFrameSize</th>
<th>Ip-MTU</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9216</td>
<td>9198</td>
</tr>
</tbody>
</table>

In Use:

<table>
<thead>
<tr>
<th>MaxFrameSize</th>
<th>Ip-MTU</th>
</tr>
</thead>
<tbody>
<tr>
<td>9216</td>
<td>9198</td>
</tr>
</tbody>
</table>

For more information about frame size, see Jumbo frames on page 163.

Operating notes for maximum frame size

- When you set a maximum frame size for jumbo frames, it must be on a global level. You cannot use the jumbo max-frame-size command on a per-port or per-VLAN basis.
- The original way to configure jumbo frames remains the same, which is per-VLAN, but you cannot set a maximum frame size per-VLAN.
- Jumbo support must be enabled for a VLAN from the CLI or through SNMP.
- Setting the maximum frame size does not require a reboot.
- When you upgrade to a version of software that supports setting the maximum frame size from a version that did not, the max-frame-size value is set automatically to 9216 bytes.
- Configuring a jumbo maximum frame size on a VLAN allows frames up to max-frame-size even though other VLANs of which the port is a member are not enabled for jumbo support.

Troubleshooting

A VLAN is configured to allow jumbo frames, but one or more ports drops all inbound jumbo frames

The port may not be operating at a minimum of 1 Gbps on the other switches covered in this guide. Regardless of a port's configuration, if it is actually operating at a speed lower than 1 Gbps for the other switches, it drops inbound jumbo frames. For example, if a port is configured for Auto mode (speed-duplex auto), but has negotiated a 7 Mbps speed with the device at the other end of the link, the port cannot receive inbound jumbo frames. To determine the actual operating speed of one or more ports, view the Mode field in the output for the following command:

`show interfaces brief <port-list>`

A non-jumbo port is generating "Excessive undersize/giant frames" messages in the Event Log

The switches can transmit outbound jumbo traffic on any port, regardless of whether the port belongs to a jumbo VLAN. In this case, another port in the same VLAN on the switch may be jumbo-enabled through membership in a different, jumbo-enabled VLAN, and may be forwarding jumbo frames received on the jumbo VLAN to non-jumbo ports.

Fault Finder

Fault Finder is a feature that helps administrators to debug unusual network activity such as flapping links or transceivers or to troubleshoot issues such as multicast or broadcast storms. Fault Finder helps in preventing network loops and taking care of situations that arise out of defective equipment and malicious attacks.

The following is the list of issues detected by the Fault Finder:

- Excessive CRC/alignment errors (bad cable)
- Excessive flapping of transceivers (bad transceiver)
- Too many undersized/giant packets (bad driver)
- Excessive late collisions (cable too long)
- High collision or drop rate (over bandwidth)
- Excessive broadcast packets (broadcast storm)
- Excessive multicast packets (multicast storm)
- Duplex mismatch (duplex mismatch HDx - reconfigure to Full Duplex)
- Duplex mismatch (duplex mismatch FDx - reconfigure port to Auto)
- Rapid detection of link faults and recoveries (link flap)
- Link loss detection (loss of link)

**Fault Finder thresholds**

Switches feature automatic fault detection, which helps protect against network loops and defective equipment. The fault detection sensitivity setting determines the types of alerts reported to the Alert Log based on their level of severity or sensitivity. The sensitivity levels are:

- **High Sensitivity.** This policy directs the switch to send all alerts to the Alert Log. This setting is most effective on networks that have none or few problems.
- **Medium Sensitivity.** This policy directs the switch to send alerts related to network problems to the Alert Log. If you want to be notified of problems which cause a noticeable slowdown on the network, use this setting.
- **Low Sensitivity.** This policy directs the switch to send only the most severe alerts to the Alert Log. This policy is most effective on a network where there are normally a lot of problems and you want to be informed of only the most severe ones
- **Disabled.** Disables the Alert Log and transmission of alerts (traps) to the management server (in cases where a network management tool such as ProCurve Manager is in use). Use this option when you don’t want to use the Alert Log.

**Enabling Fault Finder**

Enter this CLI command to enable fault detection:

**Syntax:**

```
[no] fault-finder [fault][sensitivity <low|medium|high>][action <warn|warn-and-disable>]
```

Enables or disables Fault Finder and sets sensitivity.

When the `warn-and-disable` action option is configured, Fault Finder may also shut down a bad port in addition to sending an alert to the Alert Log.

**Default setting:** `fault-finder sensitivity medium action warn`

**[fault]: Supported values are:**

- **all:** All fault types
- **bad-driver:** Too many undersized/giant packets
- **bad-transceiver:** Excessive jabbering
• **bad-cable**: Excessive CRC/alignment errors
• **too-long-cable**: Excessive late collisions
• **over-bandwidth**: High collision or drop rate
• **broadcast-storm**: Excessive broadcasts
• **duplex-mismatch-HDx**: Duplex mismatch. Reconfigure to Full Duplex
• **duplex-mismatch-FDx**: Duplex mismatch. Reconfigure port to Auto
• **link-flap**: Rapid detection of link faults and recoveries
• **loss-of-link**: Link loss detected. (Sensitivity not applicable)

**Examples:**
To set Fault Finder with a high sensitivity to issue a warning and then disable a port on which there is a high collision or drop rate, you could configure these options:

```bash
switch(config)# fault-finder over-bandwidth sensitivity high action warn-and-disable
```

To set Fault Finder with a medium sensitivity to issue a warning about excessive CRC or alignment errors on a port, you could configure these options:

```bash
switch(config)# fault-finder bad-cable sensitivity medium action warn
```

To set Fault Finder with a low sensitivity to issue a warning about rapid detection of link faults, you could configure these options:

```bash
switch(config)# fault-finder link-flap sensitivity low action warn
```

To disable Fault Finder, enter this command:

```bash
switch(config)# no fault-finder all
```

**Table 16: Fault finder sensitivities for supported conditions**

<table>
<thead>
<tr>
<th>Condition triggering fault finder</th>
<th>Sensitivities</th>
<th>Units (in packets)</th>
<th>Time period</th>
<th>Fault finder reacts:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>High</td>
<td>Medium</td>
<td>Low</td>
<td>1/10,000 Incoming</td>
</tr>
<tr>
<td>Bad driver — Too many under-sized packets or too many giant packets</td>
<td>6</td>
<td>21</td>
<td>36</td>
<td></td>
</tr>
</tbody>
</table>

*Table Continued*
<table>
<thead>
<tr>
<th>Condition triggering fault finder</th>
<th>Sensitivities</th>
<th>Units (in packets)</th>
<th>Time period</th>
<th>Fault finder reacts:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bad transceiver — Excessive jabbering - Jabbers: (Jabbers are packets longer than the MTU) - Fragments: (packets shorter than they should be)</td>
<td>65</td>
<td>2110</td>
<td>3614</td>
<td>1/10,000 IncomingOne Fragments</td>
</tr>
<tr>
<td>Bad cable — Excessive CRC/ alignment errors</td>
<td>6</td>
<td>21</td>
<td>36</td>
<td>1/10,000 Incoming</td>
</tr>
<tr>
<td>Too Long Cable — Excessive late collisions (a late collision error occurs after the first 512 bit times)</td>
<td>6</td>
<td>21</td>
<td>36</td>
<td>1/10,000 Outgoing</td>
</tr>
<tr>
<td>Over bandwidth - High collision rate - High drop rate</td>
<td>665</td>
<td>21257</td>
<td>36449</td>
<td>1/10,000 OutgoingOne Packet</td>
</tr>
<tr>
<td>Broadcast storm — Excessive broadcasts</td>
<td>1475</td>
<td>5000</td>
<td>8525</td>
<td>One Broadcast Packet</td>
</tr>
</tbody>
</table>

Table Continued
<table>
<thead>
<tr>
<th>Condition triggering fault finder</th>
<th>Sensitivities</th>
<th>Units (in packets)</th>
<th>Time period</th>
<th>Fault finder reacts:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Muticast storm — Excessive multicasts</td>
<td>1475, 5000, 8525</td>
<td>One Multicast Packet</td>
<td>1 sec</td>
<td>If the average per second of multicast packets in the last 20 seconds &gt;= sensitivity</td>
</tr>
<tr>
<td>Duplex mismatch HDx</td>
<td>6, 21, 36</td>
<td>1/10,000 Outgoing</td>
<td>20 sec</td>
<td>If (late collisions/total) &gt;= (sensitivity/10,000)</td>
</tr>
<tr>
<td>Duplex mismatch FDx</td>
<td>6, 21, 36</td>
<td>1/10,000 Incoming</td>
<td>20 sec</td>
<td>If (CRC and alignment errors/total) &gt;= (sensitivity/10,000)</td>
</tr>
<tr>
<td>Link flap — Excessive transitions between link-up and link-down states.</td>
<td>4, 7, 11</td>
<td>One Transitions</td>
<td>10 secs</td>
<td>If the Transition count in the last 10s &gt;= sensitivity.</td>
</tr>
</tbody>
</table>

**Example: of sensitivity calculation:**

If a sensitivity is set to High, and a bad cable is causing 15 CRC errors out of a total of 3500 packets transmitted in a 20 second period:

1. CRC errors/total must be >= (sensitivity/10,000) to trigger an alert.
2. CRC errors/total = 15/3500 = .00043
3. Sensitivity/10,000 = 6/10,000 = .0006
4. .00043 is not greater than or equal to .0006, so an alert is not triggered.
Using SNMP tools to manage the switch

SNMP is a management protocol that allows an SNMP client application to retrieve device configuration and status information and to configure the device (get and set). You can manage the switch via SNMP from a network management station.

To implement SNMP management, the switch must have an IP address configured either manually or dynamically (using DHCP or Bootp). If multiple VLANs are configured, each VLAN interface should have its own IP address. For DHCP use with multiple VLANs, see section "The Primary VLAN" in the "Static Virtual LANs (VLANs)" of the Advanced traffic management guide for your switch.

NOTE: If you use the switch's Authorized IP Managers and Management VLAN features, ensure that the SNMP management station, the choice of switch port used for SNMP access to the switch, or both, are compatible with the access controls enforced by these features. Otherwise, SNMP access to the switch will be blocked.

For more information on Authorized IP Managers, see the Access security guide for your switch. (The latest version of this guide is available on the Networking website.) For information on the Management VLAN feature, see the section "The Secure Management VLAN" in the "Static Virtual LANs (VLANs)" chapter of the Advanced traffic management guide for your switch.

SNMP management features

SNMP management features on the switch include:

• SNMP version 1, version 2c, or version 3 over IP
• Security via configuration of SNMP communities (SNMPv3 communities on page 180)
• Security via authentication and privacy for SNMPv3 access
• Event reporting via SNMP
  ◦ Version 1 traps
  ◦ RMON: groups 1, 2, 3, and 9
• Flow sampling using sFlow
• Standard MIBs, such as the Bridge MIB (RFC 1493), Ethernet MAU MIB (RFC 1515), and others.

The switch SNMP agent also uses certain variables that are included in an proprietary MIB (management information base) file.

1. Type a model number of your switch (For example, 8212) or product number in the Auto Search text box.
2. Select an appropriate product from the drop down list.
3. Click the Display selected button.
4. From the options that appear, select Software downloads.
5. MIBs are available with switch software in the Other category.
Click on software updates, then MIBs.

**SNMPv1 and v2c access to the switch**

SNMP access requires an IP address and subnet mask configured on the switch. If you are using DHCP/Bootp to configure the switch, ensure that the DHCP/Bootp process provides the IP address.

Once an IP address is configured, the main steps for configuring SNMPv1 and v2c access management features are:

**Procedure**

1. Configure the appropriate SNMP communities. (See **SNMPv3 communities** on page 180.)
2. Configure the appropriate trap receivers.

In some networks, authorized IP manager addresses are not used. In this case, all management stations using the correct community name may access the switch with the View and Access levels that have been set for that community. If you want to restrict access to one or more specific nodes, you can use the switch's IP Authorized Manager feature. (See the access security guide for your switch.)

---

**CAUTION:** If network management security is a concern, Hewlett Packard Enterprise recommends that you change the write access for the "public" community to "Restricted."

**SNMPv3 access to the switch**

SNMPv3 access requires an IP address and subnet mask configured on the switch. (See "IP Configuration" on page 8-2.) If you are using DHCP/Bootp to configure the switch, ensure that the DHCP/Bootp process provides the IP address. (See "DHCP/Bootp Operation").

Once you have configured an IP address, the main steps for configuring SNMPv3 access management features are the following:

**Procedure**

1. Enable SNMPv3 for operation on the switch (see **Enabling SNMPv3** on page 175).
2. Configure the appropriate SNMP users (see **SNMPv3 users** on page 176).
3. Configure the appropriate SNMP communities (see **SNMPv3 communities** on page 180).
4. Configure the appropriate trap receivers (see **SNMP notifications** on page 183).

In some networks, authorized IP manager addresses are not used. In this case, all management stations using the correct User and community name may access the switch with the View and Access levels that have been set for that community. If you want to restrict access to one or more specific nodes, you can use the IP Authorized Manager feature for the switch. (See the access security guide for your switch.)

SNMP version 3 (SNMPv3) adds some new commands to the CLI for configuring SNMPv3 functions. To enable SNMPv3 operation on the switch, use the `snmpv3 enable` command. An initial user entry will be generated with MD5 authentication and DES privacy.

You may (optionally) restrict access to only SNMPv3 agents by using the `snmpv3 only` command. To restrict write-access to only SNMPv3 agents, use the `snmpv3 restricted-access` command.
CAUTION:
Restricting access to only version 3 messages will make the community named “public” inaccessible to network management applications (such as autodiscovery, traffic monitoring, SNMP trap generation, and threshold setting) from operating in the switch.

Enabling and disabling switch for access from SNMPv3 agents
This includes the creation of the initial user record.
Syntax:

[no] snmpv3 enable

Enabling or disabling restrictions to access from only SNMPv3 agents
When enabled, the switch rejects all non-SNMPv3 messages.
Syntax:

[no] snmpv3 only

Enabling or disabling restrictions from all non-SNMPv3 agents to read-only access
Syntax:

[no] snmpv3 restricted-access

Viewing the operating status of SNMPv3
Syntax:

show snmpv3 enable

Viewing status of message reception of non-SNMPv3 messages
Syntax:

show snmpv3 only

Viewing status of write messages of non-SNMPv3 messages
Syntax:

show snmpv3 restricted-access

Enabling SNMPv3
The snmpv3 enable command allows the switch to:
• Receive SNMPv3 messages.
• Configure initial users.
• Restrict non-version 3 messages to "read only" (optional).
CAUTION: Restricting access to only version 3 messages makes the community named "public" inaccessible to network management applications (such as autodiscovery, traffic monitoring, SNMP trap generation, and threshold setting) from running on the switch.

Example:

**SNMP version 3 enable command**

```
Switch(config)# snmpv3 enable
SNMPv3 Initialization process.
Creating user 'initial'
Authentication Protocol: MD5
Enter authentication password: ******
Privacy protocol is DES
Enter privacy password: ******

User 'initial' is created
Would you like to create a user that uses SHA? y
Enter user name: templateSHA
Authentication Protocol: SHA
Enter authentication password: ******
Privacy protocol is DES
Enter privacy password: ******

User creation is done. SNMPv3 is now functional.
Would you like to restrict SNMPv1 and SNMPv2c messages to have read only access (you can set this later by the command 'snmp restrict-access'): n
```

**SNMPv3 users**

NOTE: To create new users, most SNMPv3 management software requires an initial user record to clone. The initial user record can be downgraded and provided with fewer features, but not upgraded by adding new features. For this reason, Hewlett Packard Enterprise recommends that when you enable SNMPv3, you also create a second user with SHA authentication and DES privacy.

To use SNMPv3 on the switch, you must configure the users that will be assigned to different groups:

**Procedure**

1. Configure users in the User Table with the `snmpv3 user` command.
   
   To view the list of configured users, enter the `show snmpv3 user` command (see Adding users on page 177)

2. Assign users to Security Groups based on their security model with the `snmpv3 group` command (see Assigning users to groups (CLI) on page 178).

   CAUTION: If you add an SNMPv3 user without authentication, privacy, or both, to a group that requires either feature, the user will not be able to access the switch. Ensure that you add a user with the appropriate security level to an existing security group.
Adding users

To configure an SNMPv3 user, you must first add the user name to the list of known users with the `snmpv3 user` command, as shown in the following image.

**Figure 23: Adding SNMPv3 users and displaying SNMPv3 configuration**

<table>
<thead>
<tr>
<th>User Name</th>
<th>Auth. Protocol</th>
<th>Privacy Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>initial</td>
<td>MD5</td>
<td>CFB AES-128</td>
</tr>
<tr>
<td>NetworkAdmin</td>
<td>MD5</td>
<td>CBC-DES</td>
</tr>
</tbody>
</table>

**SNMPv3 user commands**

**Syntax:**

```plaintext
[no] snmpv3 user <USER_NAME> [auth md5|sha] <AUTH_PASS> [priv des|aes] <PRIV_PASS>
```

```plaintext
[no] snmpv3 remote-engine-id <engineid> user <username> [auth {md5| sha} <authentication password>] [priv {des|aes} <privacy password>]
```

**Parameters and options**

`no`

Used to delete a user entry. When you delete a user, only the user name is required.

`<AUTH_PASS>`

With authorization, you can set either MD5 or SHA authentication. The authentication password `auth_pass` must be 6 to 32 characters and is mandatory when you configure authentication.

`priv des|aes`

With privacy, the switch supports DES (56-bit) and AES (128-bit) encryption. Defaults to DES. Only AES 128-bit and DES 56-bit encryption are supported as privacy protocols. Other non-standard encryption algorithms, such as AES-172, AES-256, and 3-DES are not supported.

`<PRIV_PASS>`

The privacy password `priv_pass` must be 6 to 32 characters and is mandatory when you configure privacy.

`remote-engine-id <engineid>`

Sets the SNMPv3 remote engine ID in colon-separated hexadecimal notation.

**Listing Users**

To display the management stations configured to access the switch with SNMPv3 and view the authentication and privacy protocols that each station uses, enter the `show snmpv3 user` command.

**Syntax:**

```
show snmpv3 user
```
Displays information about the management stations configured on VLAN 1 to access the switch.

### Display of the management stations configured on VLAN 1

```
switch# configure terminal
switch(config)# vlan 1
switch(vlan-1)# show snmpv3 user
```

**Status and Counters - SNMPv3 Global Configuration Information**

<table>
<thead>
<tr>
<th>User Name</th>
<th>Auth. Protocol</th>

</thead>
<tbody>
<tr>
<td>initial</td>
<td>MD5</td>
<td>CFB AES-128</td>
</tr>
<tr>
<td>NetworkAdmin</td>
<td>MD5</td>
<td>CBC-DES</td>
</tr>
</tbody>
</table>

### Assigning users to groups (CLI)

Next you must set the group access level for the user by assigning the user to a group. The access level for the user is done with the `snmpv3 group` command as shown in the following image. For more details on the MIBs access for a given group, see **Group access levels** on page 179.

**Figure 24: Example: of assigning users to groups**

#### Syntax:

```
[no] snmpv3 group
```

Assigns or removes a user to a security group for access rights to the switch. To delete an entry, all the following three parameters must be included in the command:

- **group <group_name>**
  - Identifies the group that has the privileges that will be assigned to the user. For more details, see **Group access levels** on page 179.

- **user <user_name>**
  - Identifies the user to be added to the access group that must match the user name added with the `snmpv3 user` command.

- **sec-model {<ver1 | ver2c | ver3>**
  - Defines which security model to use for the added user. An SNMPv3 access group use only the ver3 security model.
Group access levels

The switch supports eight predefined group access levels, shown in the following table. There are four levels for use by version 3 users and four are used for access by version 2c or version 1 management applications.

Table 17: Predefined group access levels

<table>
<thead>
<tr>
<th>Group name</th>
<th>Group access type</th>
<th>Group read view</th>
<th>Group write view</th>
</tr>
</thead>
<tbody>
<tr>
<td>managerpriv</td>
<td>Ver3 Must have Authentication and Privacy</td>

<td>DiscoveryView</td>
</tr>
</tbody>
</table>

Table 18: SNMPv3 Params and Group Configs Combinations

<table>
<thead>
<tr>
<th>SNMPv3 Params</th>
<th>SNMPv3 group</th>
<th>Snmpv3 user config</th>
</tr>
</thead>
<tbody>
<tr>
<td>noauth (no authentication and no privacy)</td>
<td>operatoroauth</td>
<td>snmpv3 user &quot;user1&quot;</td>
</tr>
<tr>
<td>auth (authentication and no privacy)</td>
<td>managerpriv, manageauth, operatorauth, operatoroauth</td>
<td>snmpv3 user &quot;user1&quot; auth md5 &quot;45800d22ccb8b485ab52fe2d8b92ea85&quot;</td>
</tr>
<tr>
<td>priv (authentication and privacy)</td>
<td>managerpriv, manageauth, operatorauth, operatoroauth</td>
<td>snmpv3 user &quot;user1&quot; auth md5 &quot;45800d22ccb8b485ab52fe2d8b92ea85&quot; priv des &quot;45800d22ccb8b485ab52fe2d8b92ea85&quot;</td>
</tr>
</tbody>
</table>

Each view allows you to view or modify a different set of MIBs:

- **Manager Read View** – access to all managed objects
- **Manager Write View** – access to all managed objects except the following:
• **OperatorReadView** – no access to the following:
  - icfSecurityMIB
  - hpSwitchIpTftpMode
  - vacmContextTable
  - vacmAccessTable
  - vacmViewTreeFamilyTable
  - usmUserTable
  - snmpCommunityTable

• **Discovery View** – Access limited to samplingProbe MIB.

---

**NOTE:** All access groups and views are predefined on the switch. There is no method to modify or add groups or views to those that are predefined on the switch.

**SNMPv3 communities**

SNMP communities are supported by the switch to allow management applications that use version 2c or version 1 to access the switch. The communities are mapped to Group Access Levels that are used for version 2c or version 1 support. This mapping happens automatically based on the communities access privileges, but special mappings can be added with the `snmpv3 community` command (see [Mapping SNMPv3 communities (CLI)] on page 180).

**Mapping SNMPv3 communities (CLI)**

SNMP communities are supported by the switch to allow management applications that use version 2c or version 1 to access the switch. For more details, see [SNMPv3 communities](#) on page 180.

**Syntax:**

```
[no] snmpv3 community
```

Maps or removes a mapping of a community name to a group access level. To remove a mapping you need to specify only the `index_name` parameter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index <code>&lt;index_name&gt;</code></td>
<td>An index number or title for the mapping. The values of 1 to 5 are reserved and can not be mapped.</td>
</tr>
<tr>
<td>name <code>&lt;community_name&gt;</code></td>
<td>The community name that is being mapped to a group access level.</td>
</tr>
<tr>
<td>sec-name <code>&lt;security_name&gt;</code></td>
<td>The group level to which the community is being mapped.</td>
</tr>
<tr>
<td>tag <code>&lt;tag_value&gt;</code></td>
<td>This is used to specify which target address may have access by way of this index reference.</td>
</tr>
</tbody>
</table>

**Example:**
The following image shows the assigning an Operator community on MgrStation1 to the CommunityOperatorReadWrite group. Any other operator has an access level of CommunityOperatorReadOnly.

**Figure 25: Assigning a community to a group access level**

```
Switch(config)# snmpv3 Community index 30 name Operator sec-name CommunityManagerReadWrite tag MgrStation1
Switch(config)# show snmpv3 community
```

<table>
<thead>
<tr>
<th>Index</th>
<th>Name</th>
<th>Security Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>public</td>
<td>CommunityManagerReadWrite</td>
</tr>
<tr>
<td>2</td>
<td>Operator</td>
<td>CommunityOperatorReadOnly</td>
</tr>
<tr>
<td>3</td>
<td>Manager</td>
<td>CommunityManagerReadWrite</td>
</tr>
<tr>
<td>30</td>
<td>Operator</td>
<td>CommunityManagerReadWrite</td>
</tr>
</tbody>
</table>

**SNMP community features**

Use SNMP communities to restrict access to the switch by SNMP management stations by adding, editing, or deleting SNMP communities. You can configure up to five SNMP communities, each with either an operator-level or a manager-level view and either restricted or unrestricted write access.

Using SNMP requires that the switch have an IP address and subnet mask compatible with your network.

**Listing community names and values (CLI)**

This command lists the data for currently configured SNMP community names (along with trap receivers and the setting for authentication traps—see **SNMP notifications** on page 183).

**Syntax:**

```
show snmp-server [< community-string >]
```

**Example:**

Lists the data for all communities in a switch; that is, both the default "public" community name and another community named "blue-team."

**Figure 26: Example: of the SNMP community listing with two communities**
To list the data for only one community, such as the "public" community, use the above command with the community name included. For Example:

```
switch# show snmp-server public
```

### Configuring community names and values (CLI)

The `snmp-server` command enables you to add SNMP communities with either default or specific access attributes, and to delete specific communities.

#### Syntax:

```
[no] snmp-server community <community-name>
```

Configures a new community name.

- If you do not also specify `operator` or `manager`, the switch automatically assigns the community to the `operator` MIB view.
- If you do not specify `restricted` or `unrestricted`, the switch automatically assigns the community to `restricted` (read-only) access.

The `no` form uses only the `<community-name>` variable and deletes the named community from the switch.

```
[operator | manager]  Optionally assigns an access level.
                    • At the operator level, the community can access all MIB objects except the CONFIG MIB.
                    • At the manager level, the community can access all MIB objects.

[restricted | unrestricted]  Optionally assigns MIB access type.
                          • Assigning the restricted type allows the community to read MIB variables, but not to set them.
                          • Assigning the unrestricted type allows the community to read and set MIB variables.
```

#### Example:

To add the following communities:

<table>
<thead>
<tr>
<th>Community</th>
<th>Access Level</th>
<th>Type of Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>red-team</td>
<td>manager (<strong>Access to all MIB objects.</strong>)</td>
<td>unrestricted (<strong>read/write</strong>)</td>
</tr>
<tr>
<td>blue-team</td>
<td>operator (<strong>Access to all MIB objects except the CONFIG MIB.</strong>)</td>
<td>restricted (<strong>read-only</strong>)</td>
</tr>
</tbody>
</table>

```
switch(config)# snmp-server community red-team
    manager unrestricted
switch(config)# snmp-server community blue-team
    operator restricted
```

To eliminate a previously configured community named "gold-team":

```
```
SNMP notifications

The switches:

- Default Traps: A switch automatically sends default traps to trap receivers using the configured community name. You have to configure and supply the community name to use in the trap-receiver config, there is no default. Use the `snmp-server host <IP_ADDRESS> community "<COMMUNITY_NAME>"` command to configure a community name and the `snmp-server host <IP_ADDRESS> community "<COMMUNITY_NAME>" trap-level [all | critical | not-info | debug | none]` command to set the level of traps to send to the community.

- SNMPv2c informs

- SNMP v3 notification process, including traps

This section describes how to configure a switch to send network security and link-change notifications to configured trap receivers.

Supported Notifications

By default, the following notifications are enabled on a switch:

- Manager password changes
- SNMP authentication failure
- Link-change traps: when the link on a port changes from up to down (linkDown) or down to up (linkUp)
- Port-security (web, MAC, or 802.1X) authentication failure
- Invalid password entered in a login attempt through a direct serial, Telnet, or SSH connection
- Inability to establish a connection with the RADIUS or TACACS+ authentication server
- DHCP snooping events
- ARP protection events

General steps for configuring SNMP notifications

Procedure

1. Determine the versions of SNMP notifications that you want to use in your network.
   If you want to use SNMPv1 and SNMPv2c traps, you must also configure a trap receiver. See the following sections and follow the required configuration procedures:
   - **SNMPv1 and SNMPv2c Traps** on page 184
   - **Configuring an SNMP trap receiver (CLI)** on page 185
   - **Enabling SNMPv2c informs (CLI)** on page 188
If you want to use SNMPv3 notifications (including traps), you must also configure an SNMPv3 management station. Follow the required configuration procedure in Configuring SNMPv3 notifications (CLI) on page 188.

2. To reconfigure any of the SNMP notifications that are enabled by default to be sent to a management station (trap receiver), see Enabling Link-Change Traps (CLI) on page 193.

3. (Optional) See the following sections to configure optional SNMP notification features and verify the current configuration:
   - Configuring the source IP address for SNMP notifications (CLI) on page 194
   - Viewing SNMP notification configuration (CLI) on page 196

### SNMPv1 and SNMPv2c Traps

The switches support the following functionality from earlier SNMP versions (SNMPv1 and SNMPv2c):

- **Trap receivers**: A trap receiver is a management station to which the switch sends SNMP traps and (optionally) event log messages sent from the switch. From the CLI you can configure up to ten SNMP trap receivers to receive SNMP traps from the switch.

- **Default Traps**: A switch automatically sends default traps to trap receivers using the configured community name. You have to configure and supply the community name to use in the trap-receiver config, there is no default. Use the `snmp-server host <IP_ADDRESS> community "<COMMUNITY_NAME>"` command to configure a community name and the `snmp-server host <IP_ADDRESS> community "<COMMUNITY_NAME>" trap-level [all | critical | not-info | debug | none]` command to set the level of traps to send to the community.

- **Thresholds**: A switch automatically sends all messages created when a system threshold is reached to the network management station that configured the threshold, regardless of the trap receiver configuration.

### SNMP trap receivers

Use the `snmp-server host` command to configure a trap receiver that can receive SNMPv1 and SNMPv2c traps, and (optionally) Event Log messages. When you configure a trap receiver, you specify its community membership, management station IP address, and (optionally) the type of Event Log messages to be sent.

If you specify a community name that does not exist—that is, has not yet been configured on the switch—the switch still accepts the trap receiver assignment. However, no traps are sent to that trap receiver until the community to which it belongs has been configured on the switch.

**NOTE:**

To replace one community name with another for the same IP address, you must first enter the

```bash
no snmp-server host <community-name> [<ipv4-address | ipv6-address>]
```

command to delete the unwanted community name. Otherwise, if you add a new community name with an IP address that is already used with a different community name, two valid community name entries are created for the same management station.

If you do not specify the event level ([none|all|not-info|critical|debug]), the switch does not send Event Log messages as traps. However, "well-known" traps and threshold traps (if configured) are still sent.
Configuring an SNMP trap receiver (CLI)

Syntax:

```
snmp-server host {< ipv4-addr | ipv6-addr >} < community name>
```

Configures a destination network management station to receive SNMPv1/v2c traps and (optionally) Event Log messages sent as traps from the switch, using the specified community name and destination IPv4 or IPv6 address. You can specify up to ten trap receivers (network management stations). (The default community name is public.)

```
[{{<none | all | not-info | critical | debug>}}]
```

(Optional) Configures the security level of the Event Log messages you want to send as traps to a trap receiver (see the following table).

- The type of Event Log message that you specify applies only to Event Log messages, not to threshold traps.
- For each configured event level, the switch continues to send threshold traps to all network management stations that have the appropriate threshold level configured.
- If you do not specify an event level, the switch uses the default value (none) and sends no Event Log messages as traps.

```
[<inform>]
```

(Optional) Configures the switch to send SNMPv2 inform requests when certain events occur. For more information, see Enabling SNMPv2c informs (CLI).

<table>
<thead>

</tr>
<tr>
<td>Debug</td>
<td>Sends only Event Log messages needed to troubleshoot network- and switch-level problems.</td>
</tr>
</tbody>
</table>

Table 19: Security levels for Event Log messages sent as traps

Example:

To configure a trap receiver in a community named "red-team" with an IP address of 10.28.227.130 to receive only "critical" event log messages, you can enter the following command:

```
switch(config)# snmp-server host 10.28.227.130 red-team critical
```

Overview

You can configure the threshold limit as a percentage for RMON event log memory. Range is between 1 to 100. An RMON log message is generated when the RMON event logging memory reaches the configured threshold percentage. If SNMP traps are enabled, then the same traps are generated for the RMON event.
Use the rmonlog-set-threshold command to set the threshold limit for RMON event log memory.

**rmonlog-set-threshold**

**Syntax**

```plaintext
rmonlog-set-threshold <percentage>
no rmonlog-set-threshold <percentage>
```

**Description**

Configures the threshold percentage for RMON event logging. The default value is 80. The `no` form of this command resets RMON event logging threshold to default value.

**Command context**

`config`

**Parameters**

`percentage`

Specifies the threshold percentage value between 1 to 100.

**Examples**

```plaintext
switch (config)# rmonlog-set-threshold 45

switch (config)# show running-config
```

Running configuration:

```
; JL071A Configuration Editor; Created on release #KB.16.06.0000x
; Ver #13:03.08.1c.fb.7f.bf.bb.7f.7c.59.fc.7b.ff.fc.ff.fc.ff.fc.ff.fc ff.3f.ef:05
hostname "switch"
module 1 type jl071x
flexible-module A type JL081A
interface A1
    speed-duplex auto-100
    exit
snmp-server community "public" unrestricted
oobm
    ip address dhcp-bootp
    exit
vlan 1
    name "DEFAULT_VLAN"
    untagged 1-24,A1-A4
    ip address dhcp-bootp
    ipv6 enable
    ipv6 address dhcp full
    exit
rmonlog-set-threshold 45
```

The following event log message is logged when the RMON log memory reaches the threshold value.

```
W 03/25/18 07:44:51 03443 system:The event log buffer is 45% full.
```

**SNMP trap when MAC address table changes**

An SNMP trap is generated when a laptop/PC is removed from the back of an IP phone and the laptop/PC MAC address ages out of the MAC table for the Aruba 2930 switch.
The mac-notify trap feature globally enables the generation of SNMP trap notifications on MAC address table changes (learns/moves/removes/ages.)

The following command enables trap for aged MAC addresses:

**Syntax:**

```
switch(config)# [no] mac-notify traps [port-list] aged
```

**Example:**

For port 1 the command is:

**Syntax:**

```
switch(config)# mac-notify traps 1 aged
```

**show command**

Use the following show command to display the different mac-notify traps configured on an interface:

**Syntax:**

```
Switch # show mac-notify traps
```

Displays the following information:

<table>
<thead>
<tr>
<th>Mac Notify Trap Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac-notify Enabled : No</td>
</tr>
<tr>
<td>Mac-move Enabled : No</td>
</tr>
<tr>
<td>Trap-interval : 30</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Port</th>
<th>MAC Addresses trap learned/removed/aged</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Learned, Removed &amp; Aged</td>
</tr>
<tr>
<td>2</td>
<td>Removed &amp; Aged</td>
</tr>
<tr>
<td>3</td>
<td>Learned &amp; Aged</td>
</tr>
<tr>
<td>4</td>
<td>Learned &amp; Removed</td>
</tr>
<tr>
<td>5</td>
<td>Aged</td>
</tr>
<tr>
<td>6</td>
<td>Learned</td>
</tr>
<tr>
<td>7</td>
<td>Removed</td>
</tr>
</tbody>
</table>

**Example:**

For port 1 the command would be as follows

```
Switch # show mac-notify traps 1
```

Displays the following information:

```
1 Aged
```

**SNMPv2c informs**

On a switch enabled for SNMPv2c, you can use the `snmp-server host inform` command (Enabling SNMPv2c informs (CLI) on page 188) to send inform requests when certain events occur. When an SNMP Manager receives an inform request, it can send an SNMP response back to the sending agent on the switch to let the agent know that the inform request reached its destination.

If the sending agent on the switch does not receive an SNMP response back from the SNMP Manager within the timeout period, the inform request may be resent, based on the retry count value.

When you enable SNMPv2c inform requests to be sent, you must specify the IP address and community name of the management station that will receive the inform notification.
Enabling SNMPv2c informs (CLI)

For information about enabling SNMPv2c informs, see SNMPv2c informs on page 187.

Syntax:

```
[no] snmp-server host {< ipv4-addr | ipv6-addr >} <community name> inform [retries < count >] [timeout < interval >]
```

Enables (or disables) the inform option for SNMPv2c on the switch and allows you to configure options for sending SNMP inform requests.

<table>
<thead>
<tr>
<th>retries</th>
<th>Maximum number of times to resend an inform request if no SNMP response is received. (Default: 3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Number of seconds to wait for an acknowledgement before resending the inform request. (Default: 15 seconds)</td>
</tr>
</tbody>
</table>

**NOTE:** The retries and timeout values are not used to send trap requests.

To verify the configuration of SNMPv2c informs, enter the `show snmp-server` command, as shown in the following image (note indication of inform Notify Type in bold):

---

**Display of SNMPv2c inform configuration**

```
switch(config)# show snmp-server

Configuring SNMPv3 notifications (CLI)

The SNMPv3 notification process allows messages that are passed via SNMP between the switch and a network management station to be authenticated and encrypted.

**Procedure**

1. Enable SNMPv3 operation on the switch by entering the `snmpv3 enable` command.
When SNMPv3 is enabled, the switch supports:

- Reception of SNMPv3 notification messages (traps and informs)
- Configuration of initial users
- (Optional) Restriction of non-SNMPv3 messages to "read only"

2. Configure SNMPv3 users by entering the `snmpv3 user` command. Each SNMPv3 user configuration is entered in the User Table.

3. Assign SNMPv3 users to security groups according to their level of access privilege by entering the `snmpv3 group` command.

4. Define the name of an SNMPv3 notification configuration by entering the `snmpv3 notify` command.

   **Syntax:**
   
   `[no] snmpv3 notify <notify_name> tagvalue <tag_name> type {inform|trap}

   Associates the name of an SNMPv3 notification configuration with a tag name used (internally) in SNMPv3 commands. To delete a notification-to-tag mapping, enter `no snmpv3 notify notify_name`.

<table>
<thead>
<tr>
<th>notify &lt;notify_name&gt;</th>
<th>Specifies the name of an SNMPv3 notification configuration.</th>
</tr>
</thead>
<tbody>
<tr>
<td>tagvalue &lt;tag_name&gt;</td>
<td>Specifies the name of a tag value used in other SNMPv3 commands, such as <code>snmpv3 targetaddress params taglist tag_name</code> in Step 5.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the notification type as <code>inform</code> or <code>trap</code>. By default, the notification type is <code>trap</code>.</td>
</tr>
</tbody>
</table>

5. Configure the target address of the SNMPv3 management station to which SNMPv3 informs and traps are sent by entering the `snmpv3 targetaddress` command.

   **Syntax:**
   
   `[no] snmpv3 targetaddress <ASCII-STR> params <ASCII-STR> <IP-ADDR> taglist <ASCII-STR>

   Configures the IPv4 or IPv6 address, name, and configuration filename of the SNMPv3 management station to which notification messages are sent.
Name of the SNMPv3 station's parameters file. The parameters filename configured with `params <ASCII-STR>` must match the `params <ASCII-STR>` value entered with the `snmpv3 params` command in Step 6. The `<IP-ADDR>` sets the IP address of the destination.

Specifies the SNMPv3 notifications (identified by one or more `<ASCII-STR>` values) to be sent to the IP address of the SNMPv3 management station.

You can enter more than one `<ASCII-STR>` value. Each `<ASCII-STR>` value must be already associated with the name of an SNMPv3 notification configuration entered with the `snmpv3 notify` command in Step 4. Use a blank space to separate values.

You can enter up to 103 characters in `<ASCII-STR>` entries following the `taglist` keyword.

(Optional) Configures the type of messages sent to a management station. (Default: none.)

(Optional) Specifies the UDP port to use. (Default: 162.)

(Optional) Specifies a range of UDP ports. (Default: 0.)

(Optional) Specifies a range of IP addresses as destinations for notification messages. (Default: 0.)

(Optional) Number of times a notification is retransmitted if no response is received. Range: 1-255. (Default: 3.)

(Optional) Time (in millisecond increments) allowed to receive a response from the target before notification packets are retransmitted. Range: 0-2147483647. (Default: 1500 (15 seconds).)  

(Optional) Maximum number of bytes supported in a notification message to the specified target. (Default: 1472)

6. Create a configuration record for the target address with the `snmpv3 params` command.

   `[no] snmpv3 params <ASCII-STR> user <user_name> sec-model <security_model> message-processing <security_service>`

Applies the configuration parameters and IP address of an SNMPv3 management station (from the `params <ASCII-STR>` value configured with the `snmpv3 targetaddress` command in Step 5) to a specified SNMPv3 user (from the `user <user_name>` value configured with the `snmpv3 user` command in Step 2).

If you enter the `snmpv3 params user` command, you must also configure a security model (`sec_model`) and message processing algorithm (`message-processing`).
{<sec_model [ver1 | ver2c | ver3]>}

Configures the security model used for SNMPv3 notification messages sent to the management station configured with the snmpv3 targetaddress command in Step 5.

If you configure the security model as ver3, you must also configure the message processing value as ver3.

{msg-processing [<ver1 | ver2c | ver3>]
 [noaut | auth | priv]}

Configures the algorithm used to process messages sent to the SNMPv3 target address.

If you configure the message processing value as ver3 and the security model as ver3, you must also configure a security services level (noauth, auth, or priv).

Example:

An example to how to configure SNMPv3 notification in the following image:

**Figure 27: Example: SNMPv3 notification configuration**

By default, a switch is enabled to send the SNMP notifications listed in Supported Notifications on page 183 when a network security event (For example, authentication failure) occurs. However, before security notifications can be sent, you must first configure one or more trap receivers or SNMPv3 management stations as described in:

1. Configuring an SNMP trap receiver (CLI) on page 185
2. Configuring SNMPv3 notifications (CLI) on page 188

You can manage the default configuration of the switch to disable and re-enable notifications to be sent for the following types of security events:

- ARP protection events
- Inability to establish a connection with the RADIUS or TACACS+ authentication server
- DHCP snooping events
- Dynamic IP Lockdown hardware resources consumed
- Link change notification

Network security notifications
- Invalid password entered in a login attempt through a direct serial, Telnet, or SSH connection
- Manager password changes
- Port-security (web, MAC, or 802.1X) authentication failure
- SNMP authentication failure
- Running configuration changes

### Enabling or disabling notification/traps for network security failures and other security events (CLI)

**Syntax:**

```
[no] snmp-server enable traps [arp-protect | auth-server-fail | dhcp-server
| dhcp-snooping | dhcpv6-snooping | dyn-ip-lockdown | dyn-ipv6-lockdown | link-change
| login-failure-mgr | mac-count-notify | mac-notify | macsec | nd-snooping | password-change-mgr
| port-security | running-config-change | snmp-authentication | startup-config-change | vsf ]
```

Enables or disables sending one of the security notification types listed below to configured trap receivers. (Unless otherwise stated, all of the following notifications are enabled in the default configuration.)

The notification sends a trap:

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp-protect</td>
<td>Traps for Dynamic ARP Protection.</td>
</tr>
<tr>
<td>auth-server-fail</td>
<td>Traps reporting authentication server unreachable.</td>
</tr>
<tr>
<td>dhcp-server</td>
<td>Traps for DHCP-Server.</td>
</tr>
<tr>
<td>dhcp-snooping</td>
<td>Traps for DHCP-Snooping.</td>
</tr>
<tr>

</tr>
<tr>
<td>password-change-mgr</td>
<td>Traps for management interface password change.</td>
</tr>
<tr>
<td>port-security</td>
<td>Traps for port access authentication failure.</td>
</tr>
</tbody>
</table>

*Table Continued*
running-config-change | Traps for running config change.
---|---
snmp-authentication [extended | Select RFC-1157 (standard) or ICF-SNMP (extended) traps.
standard] | traps.
Startup-config-change | Traps for changes to the startup configuration.
vsf | Enable traps for the VSF functionality.

To determine the specific cause of a security event, check the Event Log in the console interface to see why a trap was sent. For more information, see "Using the Event Log for Troubleshooting Switch Problems".

**Viewing the current configuration for network security notifications (CLI)**

Enter the `show snmp-server traps` command, as shown in the following example. Note that command output is a subset of the information displayed with the `show snmp-server` command in Display of SNMP notification configuration.

**Display of configured network security notifications**

```shell
switch(config)# show snmp-server traps

<td>15</td>
</tr>
</tbody>
</table>

Excluded MIBs

**Enabling Link-Change Traps (CLI)**

By default, a switch is enabled to send a trap when the link state on a port changes from up to down (linkDown) or down to up (linkUp). To reconfigure the switch to send link-change traps to configured trap receivers, enter the `snmp-server enable traps link-change` command.

**Syntax:**

```
[no] snmp-server enable traps link-change <port-list> [all]
```

Enables or disables the switch to send a link-change trap to configured trap receivers when the link state on a port goes from up to down or down to up.
Enter **all** to enable or disable link-change traps on all ports on the switch.

**Readable interface names in traps**

The SNMP trap notification messages for linkup and linkdown events on an interface includes IfDesc and IfAlias var-bind information.

**Source IP address for SNMP notifications**

The switch uses an interface IP address as the source IP address in IP headers when sending SNMP notifications (traps and informs) or responses to SNMP requests.

For multi-netted interfaces, the source IP address is the IP address of the outbound interface of the SNMP reply, which may differ from the destination IP address in the IP header of the received request. For security reasons, it may be desirable to send an SNMP reply with the IP address of the destination interface (or a specified IP address) on which the corresponding SNMP request was received.

To configure the switch to use the source IP address on which an SNMP request was received in SNMP notification or traps and replies, enter the `snmp-server response-source` and `snmp-server trap-source` commands (For more information, see **Configuring the source IP address for SNMP notifications (CLI)**).

**Configuring the source IP address for SNMP notifications (CLI)**

For more information, see **Source IP address for SNMP notifications** on page 194.

**Syntax:**

```
```

Specifies the source IP address of the SNMP response PDU. The default SNMP response PDU uses the IP address of the active interface from which the SNMP response was sent as the source IP address.

The **no** form of the command resets the switch to the default behavior (compliant with rfc-1517).

(Default: Interface IP address)

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst-ip-of-request</td>
<td>Destination IP address of the SNMP request PDU that is used as the source IP address in an SNMP response PDU.</td>
</tr>
<tr>
<td>[ipv4-addr</td>
<td>ipv6-addr]</td>
</tr>
<tr>
<td>loopback &lt;0-7&gt;</td>
<td>IP address configured for the specified loopback interface that is used as the source IP address in an SNMP response PDU. If multiple loopback IP addresses are configured, the lowest alphanumeric address is used.</td>
</tr>
</tbody>
</table>

To use the IP address of the destination interface on which an SNMP request was received as the source IP address in the IP header of SNMP traps and replies, enter the following command:

```
switch(config)# snmp-server response-source dst-ip-of-request
```

**Syntax:**

```
[no] snmp-server trap-source [ipv4-addr | loopback <0-7>]
```

Specifies the source IP address to be used for a trap PDU. To configure the switch to use a specified source IP address in generated trap PDUs, enter the `snmp-server trap-source` command.
The no form of the command resets the switch to the default behavior (compliant with rfc-1517).

(Default: Use the interface IP address in generated trap PDUs)

<table>
<thead>
<tr>
<th>ipv4-addr</th>
<th>User-defined interface IPv4 address that is used as the source IP address in generated traps. IPv6 addresses are not supported.</th>
</tr>
</thead>
<tbody>
<tr>
<td>loopback &lt;0-7&gt;</td>
<td>P address configured for the specified loopback interface that is used as the source IP address in a generated trap PDU. If multiple loopback IP addresses are configured, the lowest alphanumeric address is used.</td>
</tr>
</tbody>
</table>

**NOTE:** When you use the `snmp-server response-source` and `snmp-server trap-source` commands, note the following behavior:

- The `snmp-server response-source` and `snmp-server trap-source` commands configure the source IP address for IPv4 interfaces only.
- You must manually configure the `snmp-server response-source` value if you wish to change the default user-defined interface IP address that is used as the source IP address in SNMP traps (RFC 1517).
- The values configured with the `snmp-server response-source` and `snmp-server trap-source` commands are applied globally to all interfaces that are sending SNMP responses or SNMP trap PDUs.
- Only the source IP address field in the IP header of the SNMP response PDU can be changed.
- Only the source IP address field in the IP header and the SNMPv1 Agent Address field of the SNMP trap PDU can be changed.

**Verifying the configuration of the interface IP address used as the source IP address in IP headers for SNMP replies and traps sent from the switch (CLI)**

Enter the `show snmp-server` command to display the SNMP policy configuration, as shown in the following example.

**Display of source IP address configuration**

```
switch(config)# show snmp-server
SNMP Communities
   Community Name   MIB View Write Access
   ---------------- -------- ------------
   public           Manager  Unrestricted
Trap Receivers
   Link-Change Traps Enabled on Ports [All] : All
   ...
Excluded MIBs
Snmp Response Pdu Source-IP Information
   Selection Policy : dstIpOfRequest
Trap Pdu Source-IP Information
   Selection Policy : Configured IP
```
dstIpOfRequest: The destination IP address of the interface on which an SNMP request is received and used as the source IP address in SNMP replies.

Viewing SNMP notification configuration (CLI)

Syntax:

```
show snmp-server
```

Displays the currently configured notification settings for versions SNMPv1 and SNMPv2c traps, including SNMP communities, trap receivers, link-change traps, and network security notifications.

Example:

In the following Example, the `show snmp-server` command output shows that the switch has been configured to send SNMP traps and notifications to management stations that belong to the "public," "red-team," and "blue-team" communities.

Figure 28: Display of SNMP notification configuration

Hardware events and traps

Current default traps

The default event scenarios for currently generated traps on ArubaOS-Switches are:

- Device cold start notifications
- Device warm start notifications
- Port down notifications
- Port up notifications
• Authentication failure notifications
• Enterprise change notifications
• Intrusion alarm notifications

Event scenario matrix

Configuring the MAC address count option

The MAC Address Count feature provides a way to notify the switch management system when the number of MAC addresses learned on a switch port exceeds the permitted configurable number.

To enable the mac-count-notify option, enter this command in global config context.

**Syntax:**

```
[no] snmp-server enable traps mac-count-notify
```

Sends a trap when the number of MAC addresses learned on the specified ports exceeds the configured `<learned-count>` value.

To configure the mac-count-notify option on a port or ports, enter this command. When the configured number of MAC addresses is exceeded (the learned-count), a trap is sent.

**Syntax:**

```
[no] mac-count-notify traps <port-list> [<learned-count>]
```

Configures mac-count-notify traps on the specified ports (or all) for the entire switch.

The [no] form of the command disables mac-count-notify traps.

`<learned-count>`: The number of MAC addresses learned before sending a trap. Values range between 1-128.

Default: 32
Configuring mac-count notify traps on ports 5–7

```
switch (config)# mac-count-notify traps 5-7 50
```

Displaying information about the mac-count-notify option

Use the show mac-count-notify traps [<port-list>] command to display information about the configured value for sending a trap, the current count, and if a trap has been sent.

Information displayed for the show mac-count-notify traps command

```
switch(config)# show mac-count-notify traps
Mac-count-notify Enabled: Yes

<table>
<thead>
<tr>
<th>Port</th>
<th>Count for sending Trap</th>
<th>Count</th>
<th>Trap Sent</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
...
```

The interface context can be used to configure the value for sending a trap.

Configuring mac-count-notify traps from the interface context

```
switch(config)# interface 5
Switch (eth-5)# mac-count-notify traps 35
```

The show snmp-server traps command displays whether the MAC Address Count feature is enabled or disabled.

Information about SNMP traps, including MAC address count being Enabled/Disabled

```
switch(config)# show snmp-server traps
Trap Receivers
Link-Change Traps Enabled on Ports [All] : All

Trap Category        Current Status

Authorization Server Contact : Enabled
DHCP-Snooping        : Enabled
Dynamic ARP Protection : Enabled
Dynamic IP Lockdown  : Enabled
```
Advanced management: RMON

The switch supports RMON (remote monitoring) on all connected network segments. This allows for troubleshooting and optimizing your network.

The following RMON groups are supported:

- Ethernet Statistics (except the numbers of packets of different frame sizes)
- Alarm
- History (of the supported Ethernet statistics)
- Event

The RMON agent automatically runs in the switch. Use the RMON management station on your network to enable or disable specific RMON traps and events. Note that you can access the Ethernet statistics, Alarm and Event groups from the Switch Manager network management software.

CLI-configured sFlow with multiple instances

sFlow can also be configured via the CLI for up to three distinct sFlow instances: once enabled, an sFlow receiver/destination can be independently configured for full flow-sampling and counter-polling. CLI-configured sFlow instances may be saved to the startup configuration to persist across a switch reboot.

Configuring sFlow (CLI)

The following sFlow commands allow you to configure sFlow instances via the CLI. For more information, see Advanced management: RMON on page 202.

Syntax:

[no] sflow <receiver-instance> destination <ip-address> [<udp-port-num>]

Enables an sFlow receiver/destination. The receiver-instance number must be a 1, 2, or 3.
By default, the udp destination port number is 6343.
To disable an sFlow receiver/destination, enter no sflow receiver-instance .

Syntax:

sflow <receiver-instance> sampling <port-list> <sampling rate>
Once an sFlow receiver/destination has been enabled, this command enables flow sampling for that instance. The receiver-instance number is 1, 2, or 3, and the sampling rate is the allowable non-zero skipcount for the specified port or ports.

To disable flow-sampling for the specified port-list, repeat the above command with a sampling rate of 0.

**Syntax:**

sflow <receiver-instance> polling <port-list> <polling interval>

Once an sFlow receiver/destination has been enabled, this command enables counter polling for that instance. The receiver-instance number is 1, 2, or 3, and the polling interval may be set to an allowable non-zero value to enable polling on the specified port or ports.

To disable counter-polling for the specified port-list, repeat the above command with a polling interval of 0.

---

**NOTE:**

Under the multiple instance implementation, sFlow can be configured via the CLI or via SNMP. However, CLI-owned sFlow configurations cannot be modified via SNMP, whereas SNMP-owned instances can be disabled via the CLI using the `no sflow <receiver-instance>` command.

---

**Viewing sFlow Configuration and Status (CLI)**

The following sFlow commands allow you to display sFlow configuration and status through the CLI. Viewing sFlow destination information on page 203 is an example of sflow agent information.

**Syntax:**

```
sflow agent
```

Displays sFlow agent information. The agent address is normally the IP address of the first VLAN configured.

The `show sflow agent` command displays read-only switch agent information. The version information shows the sFlow version, MIB support, and software versions; the agent address is typically the IP address of the first VLAN configured on the switch.

---

**Viewing sflow agent information**

```
switch# show sflow agent

<table>
<thead>
<tr>
<th>Version</th>
<th>1.3;XX.11.40</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Address</td>
<td>10.0.10.228</td>
</tr>
</tbody>
</table>
```

**Syntax:**

```
show sflow <receiver instance> destination
```

Displays information about the management station to which the sFlow sampling-polling data is sent.

The `show sflow instance destination` command includes information about the management-station's destination address, receiver port, and owner, as shown in the following example.

---

**Viewing sFlow destination information**

```
switch# show sflow 2 destination

<table>
<thead>
<tr>
<th>Destination Instance</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>sFlow</td>
<td>Enabled</td>
</tr>
</tbody>
</table>
```
Datagrams Sent              221  
Destination Address         10.0.10.41  
Receiver Port               6343  
Owner                       Administrator, CLI-owned, Instance 2  
Timeout (seconds)           99995530  
Max Datagram Size           1400  
Datagram Version Support    5

Note the following details:

• **Destination Address** remains blank unless it has been configured.

• **Datagrams Sent** shows the number of datagrams sent by the switch agent to the management station since the switch agent was last enabled.

• **Timeout** displays the number of seconds remaining before the switch agent will automatically disable sFlow (this is set by the management station and decrements with time).

• **Max Datagram Size** shows the currently set value (typically a default value, but this can also be set by the management station).

Syntax:

```
show sflow <receiver instance> sampling-polling <port-list/range>
```

Displays status information about sFlow sampling and polling.

The `show sflow instance sampling-polling [port-list]` command displays information about sFlow sampling and polling on the switch, as shown in the following example. You can specify a list or range of ports for which to view sampling information.

**Figure 29: Example: Viewing sFlow sampling and polling information**

<table>
<thead>
<tr>
<th>Port</th>
<th>Sampling</th>
<th>Rate</th>
<th>Header Samples</th>
<th>Polling</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>Yes(2)</td>
<td>128</td>
<td></td>
<td>0</td>
<td>---</td>
</tr>
<tr>
<td>A2</td>
<td>---</td>
<td>---</td>
<td></td>
<td>0</td>
<td>Yes(1)</td>
</tr>
<tr>
<td>A3</td>
<td>No(1)</td>
<td>100</td>
<td></td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>A4</td>
<td>Yes(3)</td>
<td>128</td>
<td></td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** The sampling and polling instances (noted in parentheses) coupled to a specific receiver instance are assigned dynamically, and so the instance numbers may not always match. The key thing to note is whether sampling or polling is enabled on a port, and the sampling rates or polling intervals for the receiver instance configured on each port.

### Configuring UDLD Verify before forwarding

When an UDLD enabled port transitions to link-up, the port will begin with a UDLD blocking state. UDLD will probe via protocol packet exchange to determine the bidirectional state of the link. Until UDLD has completed the probe, all data traffic will be blocked. If the link is found to be bidirectional, UDLD will unblock the port for data traffic to pass. Once UDLD unblocks the port, other protocols will see the port as up and data traffic can be safely forwarded.
The default mode of a switch is “forward first then verify”. Enabling UDLD link-up will default to “forward first then verify”. To change the mode to “verify then forward”, you need to configure using the commands found in section 6.72.

**NOTE:** Link-UP data traffic will resumed after probing the link partner completes. All other protocols running will see the port as down.

### UDLD time delay

UDLD protocol informs the link partner simultaneously as it detects a state change from unidirectional to bidirectional traffic. Additional packet exchanges will be carried out by UDLD in addition to the existing UDLD exchanges whenever state changes from unidirectional to bidirectional.

**Table 20: Peer state transition timings**

<table>
<thead>
<tr>

<tr>
<td>Without triggered updates</td>
<td>State = blockedPeer State = blocked</td>
<td>State = unblockedPeer State = blocked</td>
<td>Inform PeerState = unblocked Peer State = unblocked</td>
<td>Regular UDLD TX</td>
</tr>
</tbody>
</table>

*delta is the time when the unblock event occurs on local side

### Restrictions

- There is no support available when configuring this mode from the web and menu interface.
- There are no new packet types are introduced with UDLD.
- There are no new UDLD timers being introduced.

### UDLD configuration commands

**Syntax:**

Switch(config)# link-keepalive mode [verify-then-forward | forward-then-verify]

This command configures the link-keepalive mode.

Link-keepalive provides two modes of operation, **verify-then-forward** and **forward-then-verify**.

When using the **verify-then-forward** mode, the port is in a blocking state until the link configured for UDLD establishes bidirectional communication. When using the **forward-then-verify** mode, the port forwards the data then verifies the status of the link-in state.

When a unidirectional state is detected, the port is moved to a blocked state.

When a bidirectional state is detected, the data is forwarded without interruption.

**Syntax:**

Switch(config)# link-keepalive mode verify-then-forward
Keeps the port in a logically blocked state until the link configured for UDLD has been successfully established in bi-directional communication.

**Syntax:**

```
Switch(config)# link-keepalive mode forward-then-verify
```

Forwards the data then verifies the status of the link. If a unidirectional state is detected, the port is then moved to a blocked state.

**Syntax:**

```
Switch(config)# link-keepalive interval <deciseconds>
```

Configure the interval for link-keepalive. The link-keepalive interval is the time between sending two UDLD packets. The time interval is entered in deciseconds (1/10 sec). The default keepalive interval is 50 deciseconds.

**Example:**

A value of 10 is 1 sec., 11 is 1.1 sec.

**Syntax:**

```
Switch(config)# link-keepalive retries <number>
```

Maximum number of sending attempts for UDLD packets before declaring the link as faulty.

Default keepalive attempt is 4.

**Show commands**

**Syntax:**

```
switch(config)# show link-keepalive
```

**Sample output:**

```
Total link-keepalive enabled ports: 8
Keepalive Retries : 4
Keepalive Interval: 5 sec
Keepalive Mode : verify-then-forward
Physical Keepalive Adjacent UDLD

<table>

```

**RMON generated when user changes UDLD mode**

RMON events are generated when UDLD is configured. The first time you configure the mode, the UDLD states will be re-initialized. An event log entry is initiated to include the reason for the initial UDLD blocking state during link up.

**Example:**

```
UDLD mode [verify-then-forward | forward-then-verify] is configured
```
LLDP

To standardize device discovery on all switches, LLDP is implemented while offering limited read-only support for CDP, as documented in this manual. For the latest information on your switch model, consult the Release Notes (available on the HPE Networking website). If LLDP has not yet been implemented (or if you are running an older version of software), consult a previous version of the Management and Configuration Guide for device discovery details.

**LLDP (Link Layer Discovery Protocol):** provides a standards-based method for enabling the switches covered in this guide to advertise themselves to adjacent devices and to learn about adjacent LLDP devices.

**LLDP-MED (LLDP Media Endpoint Discovery):** Provides an extension to LLDP and is designed to support VoIP deployments.

---

**NOTE:** LLDP-MED is an extension for LLDP, and the switch requires that LLDP be enabled as a prerequisite to LLDP-MED operation.

---

An SNMP utility can progressively discover LLDP devices in a network by:

**Procedure**

1. Reading a given device's Neighbors table (in the Management Information Base, or MIB) to learn about other, neighboring LLDP devices.
2. Using the information learned in step 1 to find and read the neighbor devices' Neighbors tables to learn about additional devices, and so on.

Also, by using `show` commands to access the switch's neighbor database for information collected by an individual switch, system administrators can learn about other devices connected to the switch, including device type (capability) and some configuration information. In VoIP deployments using LLDP-MED on the switches, additional support unique to VoIP applications is also available. See **LLDP-MED (media-endpoint-discovery)** on page 222.

**General LLDP operation**

An LLDP packet contains data about the transmitting switch and port. The switch advertises itself to adjacent (neighbor) devices by transmitting LLDP data packets out all ports on which outbound LLDP is enabled and by reading LLDP advertisements from neighbor devices on ports that are inbound LLDP-enabled. (LLDP is a one-way protocol and does not include any acknowledgement mechanism.) An LLDP-enabled port receiving LLDP packets inbound from neighbor devices stores the packet data in a Neighbor database (MIB).

**LLDP-MED**

This capability is an extension to LLDP and is available on the switches. See **LLDP-MED (media-endpoint-discovery)** on page 222.
Packet boundaries in a network topology

- Where multiple LLDP devices are directly connected, an outbound LLDP packet travels only to the next LLDP device. An LLDP-capable device does not forward LLDP packets to any other devices, regardless of whether they are LLDP-enabled.

- An intervening hub or repeater forwards the LLDP packets it receives in the same manner as any other multicast packets it receives. Thus, two LLDP switches joined by a hub or repeater handle LLDP traffic in the same way that they would if directly connected.

- Any intervening 802.1D device or Layer-3 device that is either LLDP-unaware or has disabled LLDP operation drops the packet.

LLDP operation configuration options

In the default configuration, LLDP is enabled and in both transmit and receive mode on all active ports. The LLDP configuration includes global settings, which apply to all active ports on the switch, and per-port settings, which affect only the operation of the specified ports.

The commands in the LLDP sections affect both LLDP and LLDP-MED operation. For information on operation and configuration unique to LLDP-MED, see LLDP-MED (media-endpoint-discovery) on page 222.

Enable or disable LLDP on the switch

In the default configuration, LLDP is globally enabled on the switch. To prevent transmission or receipt of LLDP traffic, you can disable LLDP operation.

Enable or disable LLDP-MED

In the default configuration for the switches, LLDP-MED is enabled by default. (Requires that LLDP is also enabled.) For more information, see LLDP-MED (media-endpoint-discovery) on page 222.

Change the frequency of LLDP packet transmission to neighbor devices

On a global basis, you can increase or decrease the frequency of outbound LLDP advertisements.

Change the Time-To-Live for LLDP packets sent to neighbors

On a global basis, you can increase or decrease the time that the information in an LLDP packet outbound from the switch will be maintained in a neighbor LLDP device.

Transmit and receive mode

With LLDP enabled, the switch periodically transmits an LLDP advertisement (packet) out each active port enabled for outbound LLDP transmissions and receives LLDP advertisements on each active port enabled to receive LLDP traffic (Configuring per-port transmit and receive modes (CLI) on page 217). Per-port configuration options include four modes:

- Transmit and receive (tx_rx): This is the default setting on all ports. It enables a given port to both transmit and receive LLDP packets and to store the data from received (inbound) LLDP packets in the switch's MIB.

- Transmit only (txonly): This setting enables a port to transmit LLDP packets that can be read by LLDP neighbors. However, the port drops inbound LLDP packets from LLDP neighbors without reading them. This prevents the switch from learning about LLDP neighbors on that port.
- Receive only (rxonly): This setting enables a port to receive and read LLDP packets from LLDP neighbors and to store the packet data in the switch's MIB. However, the port does not transmit outbound LLDP packets. This prevents LLDP neighbors from learning about the switch through that port.

- Disable (disable): This setting disables LLDP packet transmissions and reception on a port. In this state, the switch does not use the port for either learning about LLDP neighbors or informing LLDP neighbors of its presence.

**SNMP notification**

You can enable the switch to send a notification to any configured SNMP trap receiver(s) when the switch detects a remote LLDP data change on an LLDP-enabled port (Configuring SNMP notification support on page 216).

**Per-port (outbound) data options**

The following table lists the information the switch can include in the per-port, outbound LLDP packets it generates. In the default configuration, all outbound LLDP packets include this information in the TLVs transmitted to neighbor devices. However, you can configure LLDP advertisements on a per-port basis to omit some of this information (Configuring a remote management address for outbound LLDP advertisements (CLI) on page 217).

**Table 21: Data available for basic LLDP advertisements**

Remote Management Address

*Table Continued*
### Data type Configuration options Default Description

| Type$^{3,3}$ | N/A | Always Enabled | Shows the network address type. |
| Address$^{55}$ | Default or Configured | Uses a default address selection method unless an optional address is configured. See Remote management address on page 210. |
| System Name$^{33}$ | Enable/Disable | Enabled | Uses the switch's assigned name. |
| System Description$^{33}$ | Enable/Disable | Enabled | Includes switch model name and running software version, and ROM version. |
| Port Description$^{33}$ | Enable/Disable | Enabled | Uses the physical port identifier. |
| System capabilities supported$^{3,3}$ | Enable/Disable | Enabled | Identifies the switch's primary capabilities (bridge, router). |
| System capabilities enabled$^{3,66}$ | Enable/Disable | Enabled | Identifies the primary switch functions that are enabled, such as routing. |

1. The Packet Time-to-Live value is included in LLDP data packets.
2. Subelement of the Chassis ID TLV.
3. Populated with data captured internally by the switch. For more on these data types, refer to the IEEE P802.1AB Standard.
4. Subelement of the Port ID TLV.
5. Subelement of the Remote-Management-Address TLV.
6. Subelement of the System Capability TLV.

### Remote management address

The switch always includes an IP address in its LLDP advertisements. This can be either an address selected by a default process or an address configured for inclusion in advertisements. See IP address advertisements on page 211.

### Debug logging

You can enable LLDP debug logging to a configured debug destination (Syslog server, a terminal device, or both) by executing the `debug lldp` command. (For more information on Debug and Syslog, see the “Troubleshooting” appendix in this guide.) Note that the switch’s Event Log does not record usual LLDP update messages.

### Options for reading LLDP information collected by the switch

You can extract LLDP information from the switch to identify adjacent LLDP devices. Options include:
• Using the switch’s `show lldp info` command options to display data collected on adjacent LLDP devices—as well as the local data the switch is transmitting to adjacent LLDP devices (Displaying the global LLDP, port admin, and SNMP notification status (CLI) on page 212).

• Using an SNMP application that is designed to query the Neighbors MIB for LLDP data to use in device discovery and topology mapping.

• Using the `walkmib` command to display a listing of the LLDP MIB objects

**LLDP and LLDP-MED standards compatibility**

The operation covered by this section is compatible with these standards:

- IEEE P802.1AB
- RFC 2922 (PTOPO, or Physical Topology MIB)
- RFC 2737 (Entity MIB)
- RFC 2863 (Interfaces MIB)
- ANSI/TIA-1057/D6 (LLDP-MED; refer to LLDP-MED (media-endpoint-discovery) on page 222.)

**LLDP operating rules**

For additional information specific to LLDP-MED operation, see LLDP-MED (media-endpoint-discovery) on page 222.

**Port trunking**

LLDP manages trunked ports individually. That is, trunked ports are configured individually for LLDP operation, in the same manner as non-trunked ports. Also, LLDP sends separate advertisements on each port in a trunk, and not on a per-trunk basis. Similarly, LLDP data received through trunked ports is stored individually, per-port.

**IP address advertisements**

In the default operation, if a port belongs to only one static VLAN, the port advertises the lowest-order IP address configured on that VLAN. If a port belongs to multiple VLANs, the port advertises the lowest-order IP address configured on the VLAN with the lowest VID. If the qualifying VLAN does not have an IP address, the port advertises 127.0.0.1 as its IP address. For example, if the port is a member of the default VLAN (VID=1), and there is an IP address configured for the default VLAN, the port advertises this IP address. In the default operation, the IP address that LLDP uses can be an address acquired by DHCP or Bootp.

You can override the default operation by configuring the port to advertise any IP address that is manually configured on the switch, even if the port does not belong to the VLAN configured with the selected IP address (Configuring a remote management address for outbound LLDP advertisements (CLI) on page 217). (Note that LLDP cannot be configured through the CLI to advertise an addresses acquired through DHCP or Bootp. However, as mentioned above, in the default LLDP configuration, if the lowest-order IP address on the VLAN with the lowest VID for a given port is a DHCP or Bootp address, the switch includes this address in its LLDP advertisements unless another address is configured for advertisements on that port.) Also, although LLDP allows configuring multiple remote management addresses on a port, only the lowest-order address configured on the port will be included in outbound advertisements. Attempting to use the CLI to configure LLDP with an IP address that is either not configured on a VLAN or has been acquired by DHCP or Bootp results in the following error message.

```
xxx.xxx.xxx.xxx: This IP address is not configured or is a DHCP address.
```
Spanning-tree blocking
Spanning tree does not prevent LLDP packet transmission or receipt on STP-blocked links.

802.1X blocking
Ports blocked by 802.1X operation do not allow transmission or receipt of LLDP packets.

Configuring LLDP operation

Displaying the global LLDP, port admin, and SNMP notification status (CLI)
In the default configuration, LLDP is enabled and in both transmit and receive mode on all active ports. The LLDP configuration includes global settings that apply to all active ports on the switch, and per-port settings that affect only the operation of the specified ports.

The commands in this section affect both LLDP and LLDP-MED operation. For information on operation and configuration unique to LLDP-MED, refer to “LLDP-MED (Media-Endpoint-Discovery)”.

Syntax:

show lldp config

Displays the LLDP global configuration, LLDP port status, and SNMP notification status. For information on port admin status, see Configuring per-port transmit and receive modes (CLI) on page 217.

show lldp config produces the following display when the switch is in the default LLDP configuration:

<table>
<thead>
<tr>
<th>LLDP Port Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
</tr>
<tr>
<td>-----</td>
</tr>
<tr>
<td>A1</td>
</tr>
<tr>
<td>A2</td>
</tr>
<tr>
<td>A3</td>
</tr>
<tr>
<td>A4</td>
</tr>
<tr>
<td>A5</td>
</tr>
<tr>
<td>A6</td>
</tr>
<tr>
<td>A7</td>
</tr>
<tr>
<td>A8</td>
</tr>
</tbody>
</table>

NOTE: The values displayed in the LLDP column correspond to the lldp refresh-interval command
Viewing port configuration details (CLI)

Syntax:

```
show lldp config <port-list>
```

Displays the LLDP port-specific configuration for all ports in `<port-list>`, including which optional TLVs and any non-default IP address that are included in the port's outbound advertisements.

For information on the notification setting, see Configuring SNMP notification support on page 216. For information on the other configurable settings displayed by this command, see Configuring per-port transmit and receive modes (CLI) on page 217.

Figure 30: Per-port configuration display

Configuring Global LLDP Packet Controls

The commands in this section configure the aspects of LLDP operation that apply the same to all ports in the switch.

LLDP operation on the switch

Enabling LLDP operation (the default) causes the switch to:

- Use active, LLDP-enabled ports to transmit LLDP packets describing itself to neighbor devices.
- Add entries to its neighbors table based on data read from incoming LLDP advertisements.

Enabling or disabling LLDP operation on the switch (CLI)

For more information, see LLDP operation on the switch on page 213.

Syntax:

```
[no] lldp run
```
Enables or disables LLDP operation on the switch.

The no form of the command, regardless of individual LLDP port configurations, prevents the switch from transmitting outbound LLDP advertisements and causes the switch to drop all LLDP advertisements received from other devices.

The switch preserves the current LLDP configuration when LLDP is disabled. After LLDP is disabled, the information in the LLDP neighbors database remains until it times-out.

(Default: Enabled)

### Disabling LLDP

switch(config)# no lldp run

### Changing the packet transmission interval (CLI)

This interval controls how often active ports retransmit advertisements to their neighbors.

**Syntax:**

```plaintext
lldp refresh-interval <5-32768>
```

Changes the interval between consecutive transmissions of LLDP advertisements on any given port.

( Default: 30 seconds)

**NOTE:**

The `refresh-interval` must be greater than or equal to `(4 x delay-interval)`. (The default delay-interval is 2). For example, with the default delay-interval, the lowest refresh-interval you can use is 8 seconds `(4 x 2=8)`. Thus, if you want a refresh-interval of 5 seconds, you must first change the delay interval to 1 (that is, `4 x 1 5`). If you want to change the delay-interval, use the `setmib` command.

### Time-to-Live for transmitted advertisements

The Time-to-Live value (in seconds) for all LLDP advertisements transmitted from a switch is controlled by the switch that generates the advertisement and determines how long an LLDP neighbor retains the advertised data before discarding it. The Time-to-Live value is the result of multiplying the `refresh-interval` by the `holdtime-multiplier`.

### Changing the time-to-live for transmitted advertisements (CLI)

For more information, see **Time-to-Live for transmitted advertisements** on page 214.

**Syntax:**

```plaintext
lldp holdtime-multiplier <2-10>
```

Changes the multiplier an LLDP switch uses to calculate the Time-to-Live for the LLDP advertisements it generates and transmits to LLDP neighbors. When the Time-to-Live for a given advertisement expires, the advertised data is deleted from the neighbor switch’s MIB.

(Default: 4; Range 2–10)

**Example:**

If the `refresh-interval` on the switch is 15 seconds and the `holdtime-multiplier` is at the default, the Time-to-Live for advertisements transmitted from the switch is 60 seconds `(4 x 15)`.

To reduce the Time-to-Live, you could lower the `holdtime-interval` to 2, which would result in a Time-to-Live of 30 seconds.
Delay interval between advertisements generated by value or status changes to the LLDP MIB

The switch uses a delay-interval setting to delay transmitting successive advertisements resulting from these LLDP MIB changes. If a switch is subject to frequent changes to its LLDP MIB, lengthening this interval can reduce the frequency of successive advertisements. You can change the delay-interval by using either an SNMP network management application or the CLI setmib command.

Changing the delay interval between advertisements generated by value or status changes to the LLDP MIB (CLI)

Syntax:

```
setmib lldpTxDelay.0 -i <1-8192>
```

Uses setmib to change the minimum time (delay-interval) any LLDP port will delay advertising successive LLDP advertisements because of a change in LLDP MIB content.

(Default: 2; Range 1–8192)

**NOTE:** The LLDP refresh-interval (transmit interval) must be greater than or equal to (4 x delay-interval). The switch does not allow increasing the delay interval to a value that conflicts with this relationship. That is, the switch displays Inconsistent value if (4 x delay-interval) exceeds the current transmit interval, and the command fails. Depending on the current refresh-interval setting, it may be necessary to increase the refresh-interval before using this command to increase the delay-interval.

Example:

To change the delay-interval from 2 seconds to 8 seconds when the refresh-interval is at the default 30 seconds, you must first set the refresh-interval to a minimum of 32 seconds (32 = 4 x 8) as shown in the following image.

**Figure 31:** Changing the transmit-delay interval

Reinitialization delay interval

In the default configuration, a port receiving a disable command followed immediately by a txonly, rxonly, or tx rx command delays reinitializing for two seconds, during which LLDP operation remains disabled. If an active port is subjected to frequent toggling between the LLDP disabled and enabled states, LLDP advertisements are more frequently transmitted to the neighbor device. Also, the neighbor table in the adjacent device changes more frequently as it deletes, then replaces LLDP data for the affected port which, in turn, generates SNMP traps (if trap receivers and SNMP notification are configured). All of this can unnecessarily increase network traffic. Extending the reinitialization-delay interval delays the ability of the port to reinitialize and generate LLDP traffic following an LLDP disable/enable cycle.
Changing the reinitialization delay interval (CLI)

Syntax:

setmib lldpReinitDelay.0 -i <1-10>

Uses setmib to change the minimum time (reinitialization delay interval) an LLDP port will wait before reinitializing after receiving an LLDP disable command followed closely by a txonly or tx_rx command. The delay interval commences with execution of the lldp admin-status port-list disable command.

(Default: 2 seconds; Range 1–10 seconds)

Example:

The following command changes the reinitialization delay interval to five seconds:

switch(config)# setmib lldpreinitdelay.0 -i 5

Configuring SNMP notification support

You can enable SNMP trap notification of LLDP data changes detected on advertisements received from neighbor devices, and control the interval between successive notifications of data changes on the same neighbor.

Enabling LLDP data change notification for SNMP trap receivers (CLI)

Syntax:

[no] lldp enable-notification <port-list>

Enables or disables each port in port-list for sending notification to configured SNMP trap receivers if an LLDP data change is detected in an advertisement received on the port from an LLDP neighbor.

(Default: Disabled)

For information on configuring trap receivers in the switch, see SNMP notifications on page 183.

Example:

This command enables SNMP notification on ports 1 - 5:

switch(config)# lldp enable-notification 1-5

Changing the minimum interval for successive data change notifications for the same neighbor

If LLDP trap notification is enabled on a port, a rapid succession of changes in LLDP information received in advertisements from one or more neighbors can generate a high number of traps. To reduce this effect, you can globally change the interval between successive notifications of neighbor data change.

Syntax:

setmib lldpnotificationinterval.0 -i <1-3600>

Globally changes the interval between successive traps generated by the switch. If multiple traps are generated in the specified interval, only the first trap is sent. The remaining traps are suppressed. (A network management application can periodically check the switch MIB to detect any missed change notification traps. See IEEE P802.1AB or later for more information.)

(Default: 5 seconds)

Example:

The following command limits change notification traps from a particular switch to one per minute.
Configuring per-port transmit and receive modes (CLI)

Syntax:

```plaintext
lldp admin-status <port-list> {<txonly | rxonly | tx_rx | disable>}
```

With LLDP enabled on the switch in the default configuration, each port is configured to transmit and receive LLDP packets. These options enable you to control which ports participate in LLDP traffic and whether the participating ports allow LLDP traffic in only one direction or in both directions.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>txonly</td>
<td>Configures the specified ports to transmit LLDP packets, but block inbound LLDP packets from neighbor devices.</td>
</tr>
<tr>
<td>rxonly</td>
<td>Configures the specified ports to receive LLDP packets from neighbors, but block outbound packets to neighbors.</td>
</tr>
<tr>
<td>tx_rx</td>
<td>Configures the specified ports to both transmit and receive LLDP packets. (This is the default setting.)</td>
</tr>
<tr>
<td>disable</td>
<td>Disables LLDP packet transmit and receive on the specified ports.</td>
</tr>
</tbody>
</table>

Basic LLDP per-port advertisement content

In the default LLDP configuration, outbound advertisements from each port on the switch include both mandatory and optional data.

**Mandatory Data**

An active LLDP port on the switch always includes the mandatory data in its outbound advertisements. LLDP collects the mandatory data, and, except for the Remote Management Address, you cannot use LLDP commands to configure the actual data.

- Chassis Type (TLV subelement)
- Chassis ID (TLV)
- Port Type (TLV subelement)
- Port ID (TLV)
- Remote Management Address (TLV; actual IP address is a subelement that can be a default address or a configured address)

Configuring a remote management address for outbound LLDP advertisements (CLI)

This is an optional command you can use to include a specific IP address in the outbound LLDP advertisements for specific ports. For more information, see Basic LLDP per-port advertisement content on page 217.

Syntax:

```
[no] lldp config <port-list> ipAddrEnable <ip-address>
```

Replaces the default IP address for the port with an IP address you specify. This can be any IP address configured in a static VLAN on the switch, even if the port does not belong to the VLAN configured with the selected IP address.

The `no` form of the command deletes the specified IP address.
If there are no IP addresses configured as management addresses, the IP address selection method returns to the default operation.

Default: The port advertises the IP address of the lowest-numbered VLAN (VID) to which it belongs. If there is no IP address configured on the VLANs to which the port belongs, and if the port is not configured to advertise an IP address from any other (static) VLAN on the switch, the port advertises an address of 127.0.0.1.)

NOTE: This command does not accept either IP addresses acquired through DHCP or Bootp, or IP addresses that are not configured in a static VLAN on the switch.

Example:

If port 3 belongs to a subnetted VLAN that includes an IP address of 10.10.10.100 and you want port 3 to use this secondary address in LLDP advertisements, you need to execute the following command:

```
switch(config)# lldp config 3 ipAddrEnable 10.10.10.100
```

Syntax:

```
[no] lldp config <port-list> basicTlvEnable <TLV-Type>
```

<table>
<thead>
<tr>
<th>TLV Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_descr</td>
<td>For outbound LLDP advertisements, this TLV includes an alphanumeric string describing the port. (Default: Enabled)</td>
</tr>
<tr>
<td>system_name</td>
<td>For outbound LLDP advertisements, this TLV includes an alphanumeric string showing the assigned name of the system. (Default: Enabled)</td>
</tr>
<tr>
<td>system_descr</td>
<td>For outbound LLDP advertisements, this TLV includes an alphanumeric string describing the full name and version identification for the hardware type, software version, and networking application of the system. (Default: Enabled)</td>
</tr>
<tr>
<td>system_cap</td>
<td>For outbound advertisements, this TLV includes a bitmask of supported system capabilities (device functions). Also includes information on whether the capabilities are enabled. (Default: Enabled)</td>
</tr>
</tbody>
</table>

Example:

If you want to exclude the system name TLV from the outbound LLDP advertisements for all ports on a switch, use this command:

```
switch(config)# no lldp config 1-24 basicTlvEnable system_name
```

If you later decide to reinstate the system name TLV on ports 1-5, use this command:

```
switch(config)# lldp config 1-5 basicTlvEnable system_name
```

Optional Data

You can configure an individual port or group of ports to exclude one or more of the following data types from outbound LLDP advertisements.

- Port description (TLV)
- System name (TLV)
- System description (TLV)
- System capabilities (TLV)
Optional data types, when enabled, are populated with data internal to the switch; that is, you cannot use LLDP commands to configure their actual content.

**Support for port speed and duplex advertisements**

This feature is optional for LLDP operation, but is **required** for LLDP-MED operation.

Port speed and duplex advertisements are supported on the switches to inform an LLDP endpoint and the switch port of each other's port speed and duplex configuration and capabilities. Configuration mismatches between a switch port and an LLDP endpoint can result in excessive collisions and voice quality degradation. LLDP enables discovery of such mismatches by supporting SNMP access to the switch MIB for comparing the current switch port and endpoint settings. (Changing a current device configuration to eliminate a mismatch requires intervention by the system operator.)

An SNMP network management application can be used to compare the port speed and duplex data configured in the switch and advertised by the LLDP endpoint. You can also use the CLI to display this information. For more information on using the CLI to display port speed and duplex information, see [Viewing the current port speed and duplex configuration on a switch port](#) on page 233.

**Configuring support for port speed and duplex advertisements (CLI)**

For more information, see [Support for port speed and duplex advertisements](#) on page 219.

**Syntax:**

```
[no] lldp config <port-list> dot3TlvEnable macphy_config
```

**Options**

- `macphy_config`
  - MAC Physical Config TLV
- `poeplus_config`
  - Power Via MDI Config TLV
- `eee_config`
  - EEE Config TLV

For outbound advertisements, this TLV includes the (local) switch port's current speed and duplex settings, the range of speed and duplex settings the port supports, and the method required for reconfiguring the speed and duplex settings on the device (autonegotiation during link initialization, or manual configuration).

Using SNMP to compare local and remote information can help in locating configuration mismatches.

(Default: Enabled)

**NOTE:** For LLDP operation, this TLV is optional. For LLDP-MED operation, this TLV is mandatory.

---

**Port VLAN ID TLV support on LLDP**

The `port-vlan-id` option enables advertisement of the port VLAN ID TLV as part of the regularly advertised TLVs. This allows discovery of a mismatch in the configured native VLAN ID between LLDP peers. The information is visible using `show` commands and is logged to the Syslog server.
Configuring the VLAN ID TLV

This TLV advertisement is enabled by default. To enable or disable the TLV, use this command. For more information, see Port VLAN ID TLV support on LLDP Port VLAN ID TLV support on LLDP on page 219.

Syntax:

[no] lldp config <port-list> dot1TlvEnable port-vlan-id

Enables the VLAN ID TLV advertisement.
The no form of the command disables the TLV advertisement.

Default: Enabled.

Options

port-vlan-id

  Specifies the 802.1 TLV list to advertise.

vlan-name

  Specifies that the VLAN name TLV is to be advertised.

Enabling the VLAN ID TLV

Switch(config)# lldp config a1 dot1TlvEnable port-vlan-id

Viewing the TLVs advertised

The show commands display the configuration of the TLVs. The command show lldp config lists the TLVs advertised for each port, as shown in the following examples.

Displaying the TLVs for a port

switch(config)# show lldp config a1

LLDP Port Configuration Detail

  Port : A1
  AdminStatus [Tx_Rx] : Tx_Rx
  NotificationEnabled [False] : False
  Med Topology Trap Enabled [False] : False

PortDescr    : A1
System Capabilities Supported : bridge, router
System Capabilities Enabled   : bridge, router
Port VLAN ID : 200
Remote Management Address
  Type : ipv4
  Address : 192.168.1.1

SNMP support

The LLDP-EXT-DOT1-MIB has the corresponding MIB variables for the Port VLAN ID TLV. The TLV advertisement can be enabled or disabled using the MIB object `lldpXdot1ConfigPortVlanTxEnable` in the `lldpXdot1ConfigPortVlanTable`.

The port VLAN ID TLV local information can be obtained from the MIB object `lldpXdot1LocPortVlanId` in the local information table `lldpXdot1LocTable`.

The port VLAN ID TLV information about all the connected peer devices can be obtained from the MIB object `lldpXdot1RemPortVlanId` in the remote information table `lldpXdot1RemTable`. 
LLDP-MED (media-endpoint-discovery)

LLDP-MED (ANSI/TIA-1057/D6) extends the LLDP (IEEE 802.1AB) industry standard to support advanced features on the network edge for Voice Over IP (VoIP) endpoint devices with specialized capabilities and LLDP-MED standards-based functionality. LLDP-MED in the switches uses the standard LLDP commands described earlier in this section, with some extensions, and also introduces new commands unique to LLDP-MED operation. The show commands described elsewhere in this section are applicable to both LLDP and LLDP-MED operation. LLDP-MED benefits include:

- Plug-and-play provisioning for MED-capable, VoIP endpoint devices
- Simplified, vendor-independent management enabling different IP telephony systems to interoperate on one network
- Automatic deployment of convergence network policies (voice VLANs, Layer 2/CoS priority, and Layer 3/QoS priority)
- Configurable endpoint location data to support the Emergency Call Service (ECS) (such as Enhanced 911 service, 999, 112)
- Detailed VoIP endpoint data inventory readable via SNMP from the switch
- Power over Ethernet (PoE) status and troubleshooting support via SNMP
- Support for IP telephony network troubleshooting of call quality issues via SNMP

This section describes how to configure and use LLDP-MED features in the switches to support VoIP network edge devices (media endpoint devices) such as:

- IP phones
- Voice/media gateways
- Media servers
- IP communications controllers
- Other VoIP devices or servers

Figure 32: Example of LLDP-MED network elements

LLDP-MED endpoint support

LLDP-MED interoperates with directly connected IP telephony (endpoint) clients having these features and services:
• Autonegotiate speed and duplex configuration with the switch

• Use the following network policy elements configured on the client port
  ◦ Voice VLAN ID
  ◦ 802.1p (Layer 2) QoS
  ◦ Diffserv codepoint (DSCP) (Layer 3) QoS

• Discover and advertise device location data learned from the switch

• Support ECS (such as E911, 999, and 112)

• Advertise device information for the device data inventory collected by the switch, including:

<table>
<thead>
<tr>
<th>Hardware revision</th>
<th>Software revision</th>
<th>Manufacturer name</th>
<th>Asset ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware revision</td>
<td>Serial number</td>
<td>Model name</td>
<td></td>
</tr>
</tbody>
</table>

• Provide information on network connectivity capabilities (For example, a multi-port VoIP phone with Layer 2 switch capability)

• Support the fast-start capability

NOTE:

LLDP-MED is intended for use with VoIP endpoints and is not designed to support links between network infrastructure devices, such as switch-to-switch or switch-to-router links.

LLDP-MED endpoint device classes

LLDP-MED endpoint devices are, by definition, located at the network edge and communicate using the LLDP-MED framework. Any LLDP-MED endpoint device belongs to one of the following three classes:

• Class 1 (generic endpoint devices): These devices offer the basic LLDP discovery services, network policy advertisement (VLAN ID, Layer 2/802.1p priority, and Layer 3/DSCP priority), and PoE management. This class includes such devices as IP call controllers and communication-related servers.

• Class 2 (media endpoint devices): These devices offer all Class 1 features plus media-streaming capability, and include such devices as voice/media gateways, conference bridges, and media servers.

• Class 3 (communication devices): These devices are typically IP phones or end-user devices that otherwise support IP media and offer all Class 1 and Class 2 features, plus location identification and emergency 911 capability, Layer 2 switch support, and device information management.

LLDP-MED operational support

The switches offer two configurable TLVs supporting MED-specific capabilities:

• medTlvEnable (for per-port enabling or disabling of LLDP-MED operation)
• medPortLocation (for configuring per-port location or emergency call data)
LLDP-MED fast start control

Syntax:

```
lldp fast-start-count <1-10>
```

An LLDP-MED device connecting to a switch port may use the data contained in the MED TLVs from the switch to configure itself. However, the `lldp refresh-interval` setting (default: 30 seconds) for transmitting advertisements can cause an unacceptable delay in MED device configuration.

To support rapid LLDP-MED device configuration, the `lldp fast-start-count` command temporarily overrides the `refresh-interval` setting for the `fast-start-count` advertisement interval. This results in the port initially advertising LLDP-MED at a faster rate for a limited time. Thus, when the switch detects a new LLDP-MED device on a port, it transmits one LLDP-MED advertisement per second out the port for the duration of the `fast-start-count` interval. In most cases, the default setting should provide an adequate `fast-start-count` interval.

(Default: 5 seconds)

NOTE:
This global command applies only to ports on which a new LLDP-MED device is detected. It does not override the `refresh-interval` setting on ports where non-MED devices are detected.

Advertising device capability, network policy, PoE status and location data

The `medTlvEnable` option on the switch is enabled in the default configuration and supports the following LLDP-MED TLVs:

- LLDP-MED capabilities: This TLV enables the switch to determine:
  - Whether a connected endpoint device supports LLDP-MED
  - Which specific LLDP-MED TLVs the endpoint supports
  - The device class (1, 2, or 3) for the connected endpoint

  This TLV also enables an LLDP-MED endpoint to discover what LLDP-MED TLVs the switch port currently supports.

- Network policy operating on the port to which the endpoint is connected (VLAN, Layer 2 QoS, Layer 3 QoS)
- PoE (MED Power-over-Ethernet)
- Physical location data (see Configuring location data for LLDP-MED devices on page 227)
NOTE: LLDP-MED operation requires the macphy_config TLV subelement (enabled by default) that is optional for IEEE 802.1AB LLDP operation. For more information, see the dot3TlvEnable macphy_config command (Configuring support for port speed and duplex advertisements (CLI) on page 219).

Network policy advertisements

Network policy advertisements are intended for real-time voice and video applications, and include these TLV subelements:

- Layer 2 (802.1p) QoS
- Layer 3 DSCP (diffserv code point) QoS
- Voice VLAN ID (VID)

VLAN operating rules

These rules affect advertisements of VLANs in network policy TLVs:

- The VLAN ID TLV subelement applies only to a VLAN configured for voice operation (vlan <vid> voice).
- If there are multiple voice VLANs configured on a port, LLDP-MED advertises the voice VLAN having the lowest VID.
- The voice VLAN port membership configured on the switch can be tagged or untagged. However, if the LLDP-MED endpoint expects a tagged membership when the switch port is configured for untagged, or the reverse, a configuration mismatch results. (Typically, the endpoint expects the switch port to have a tagged voice VLAN membership.)
- If a given port does not belong to a voice VLAN, the switch does not advertise the VLAN ID TLV through this port.

Policy elements

These policy elements may be statically configured on the switch or dynamically imposed during an authenticated session on the switch using a RADIUS server and 802.1X or MAC authentication. (Web authentication does not apply to VoIP telephones and other telecommunications devices that are not capable of accessing the switch through a Web browser.) The QoS and voice VLAN policy elements can be statically configured with the following CLI commands:

```plaintext
vlan <vid> voice
vlan <vid> {<tagged | untagged> <port-list>}
int <port-list> qos priority <0-7>
 vlan <vid> qos dscp <codepoint>
```

NOTE: A codepoint must have an 802.1p priority before you can configure it for use in prioritizing packets by VLAN-ID. If a codepoint you want to use shows No Override in the Priority column of the DSCP policy table (display with show qos-dscp map, then use qos-dscp map <codepoint> priority <0-7> to configure a priority before proceeding. For more information on this topic, see the "Quality of Service (QoS): Managing Bandwidth More Effectively" in the advanced traffic management guide for your switch.

Enabling or Disabling medTlvEnable

In the default LLDP-MED configuration, the TLVs controlled by medTlvEnable are enabled. For more information, see Advertising device capability, network policy, PoE status and location data on page 224.
Syntax:

[no] lldp config <port-list> medTlvEnable <medTlv>

Enables or disables advertisement of the following TLVs on the specified ports:

- Device capability TLV
- Configured network policy TLV
- Configured location data TLV (see Configuring location data for LLDP-MED devices on page 227.)
- Current PoE status TLV

(DefaultValue: All of the above TLVs are enabled.)

Helps to locate configuration mismatches by allowing use of an SNMP application to compare the LLDP-MED configuration on a port with the LLDP-MED TLVs advertised by a neighbor connected to that port.

| capabilities   | This TLV enables the switch to determine:          |
|               | • Which LLDP-MED TLVs a connected endpoint can discover |
|               | • The device class (1, 2, or 3) for the connected endpoint |
|               | This TLV also enables an LLDP-MED endpoint to discover what LLDP-MED TLVs the switch port currently supports. (Default: enabled) |
|               | This TLV cannot be disabled unless the network_policy, poe, and location_id TLVs are already disabled. |

| network_policy | This TLV enables the switch port to advertise its configured network policies (voice VLAN, Layer 2 QoS, Layer 3 QoS), and allows LLDP-MED endpoint devices to autoconfigure the voice network policy advertised by the switch. This also enables the use of SNMP applications to troubleshoot statically configured endpoint network policy mismatches. (Default: Enabled) |
|               | Network policy is advertised only for ports that are configured as members of the voice VLAN. If the port belongs to more than one voice VLAN, the voice VLAN with the lowest-numbered VID is selected as the VLAN for voice traffic. Also, this TLV cannot be enabled unless the capability TLV is already enabled. |
|               | For more information, see Network policy advertisements on page 225. |

| location_id   | This TLV enables the switch port to advertise its configured location data (if any). For more information on configuring location data, see Configuring location data for LLDP-MED devices on page 227. (Default: Enabled) |
|               | When disabled, this TLV cannot be enabled unless the capability TLV is already enabled. |

| poe           | This TLV enables the switch port to advertise its current PoE state and to read the PoE requirements advertised by the LLDP-MED endpoint device connected to the port. (Default: Enabled) |
|               | When disabled, this TLV cannot be enabled unless the capability TLV is already enabled. |
|               | For more on this topic, see PoE advertisements on page 227. |
**PoE advertisements**

These advertisements inform an LLDP-MED endpoint of the power (PoE) configuration on switch ports. Similar advertisements from an LLDP-MED endpoint inform the switch of the endpoint’s power needs and provide information that can be used to identify power priority mismatches.

PoE TLVs include the following power data:

- **Power type**: indicates whether the device is a power-sourcing entity (PSE) or a PD. Ports on the J8702A PoE zl module are PSE devices. A MED-capable VoIP telephone is a PD.
- **Power source**: indicates the source of power in use by the device. Power sources for PDs include PSE, local (internal), and PSE/local. The switches advertise Unknown.
- **Power priority**: indicates the power priority configured on the switch (PSE) port or the power priority configured on the MED-capable endpoint.
- **Power value**: indicates the total power in watts that a switch port (PSE) can deliver at a particular time, or the total power in watts that the MED endpoint (PD) requires to operate.

**Viewing PoE advertisements**

To display the current power data for an LLDP-MED device connected to a port, use the following command:

```
show lldp info remote-device <port-list>
```

For more information on this command, see page A-60.

To display the current PoE configuration on the switch, use the following commands:

```
show power brief <port-list>
show power <port-list>
```

**Location data for LLDP-MED devices**

You can configure a switch port to advertise location data for the switch itself, the physical wall-jack location of the endpoint (recommended), or the location of a DHCP server supporting the switch, endpoint, or both. You also have the option of configuring these different address types:

- **Civic address**: physical address data such as city, street number, and building information
- **ELIN (Emergency Location Identification Number)**: an emergency number typically assigned to MLTS (Multiline Telephone System) Operators in North America
- **Coordinate-based location**: attitude, longitude, and altitude information (Requires configuration via an SNMP application.)

**Configuring location data for LLDP-MED devices**

**Syntax:**

```
[no] lldp config <port-list> medPortLocation <Address-Type>
```

Configures location of emergency call data the switch advertises per port in the location_id TLV. This TLV is for use by LLDP-MED endpoints employing location-based applications.
NOTE: The switch allows one medPortLocation entry per port (without regard to type). Configuring a new medPortLocation entry of any type on a port replaces any previously configured entry on that port.

civic-addr <COUNTRY-STR> <WHAT> <CA-TYPE> <CA-VALUE> ... [< CA-TYPE > < CA-VALUE >] ... [< CA-TYPE > < CA-VALUE >]

Enables configuration of a physical address on a switch port and allows up to 75 characters of address information.

| COUNTRY-STR | A two-character country code, as defined by ISO 3166. Some examples include FR (France), DE (Germany), and IN (India). This field is required in a civic-addr command. (For a complete list of country codes, visit http://www.iso.org.) |
| WHAT | A single-digit number specifying the type of device to which the location data applies:
| 0: Location of DHCP server
| 1: Location of switch
| 2: Location of LLDP-MED endpoint (recommended application)

This field is required in a civic-addr command.

Table Continued
### Type/Value Pairs (CA-TYPE and CA-VALUE)

A series of data pairs, each composed of a location data "type" specifier and the corresponding location data for that type. That is, the first value in a pair is expected to be the civic address "type" number (CA-TYPE), and the second value in a pair is expected to be the corresponding civic address data (CA-VALUE).

For example, if the CA-TYPE for "city name" is "3," the type/value pair to define the city of Paris is "3 Paris."

Multiple type/value pairs can be entered in any order, although Hewlett Packard Enterprise recommends that multiple pairs be entered in ascending order of the CA-TYPE.

When an emergency call is placed from a properly configured class 3 endpoint device to an appropriate PSAP, the country code, device type, and type/value pairs configured on the switch port are included in the transmission. The "type" specifiers are used by the PSAP to identify and organize the location data components in an understandable format for response personnel to interpret.

A **civic-addr** command requires a minimum of one type/value pair, but typically includes multiple type/value pairs as needed to configure a complete set of data describing a given location.

**CA-TYPE**: This is the first entry in a type/value pair and is a number defining the type of data contained in the second entry in the type/value pair (CA-VALUE). Some examples of CA-TYPE specifiers include:

- 3=city
- 6=street (name)
- 25=building name

(Range: 0 - 255) For a sample listing of CA-TYPE specifiers, see Some location codes used in CA-TYPE fields.

**CA-VALUE**: This is the second entry in a type/value pair and is an alphanumeric string containing the location information corresponding to the immediately preceding CA-TYPE entry.

Strings are delimited by either blank spaces, single quotes (' … '), or double quotes (" … ").

Each string should represent a specific data type in a set of unique type/value pairs comprising the description of a location, and each string must be preceded by a CA-TYPE number identifying the type of data in the string.

A switch port allows one instance of any given CA-TYPE. For example, if a type/value pair of 6 Atlantic (to specify "Atlantic" as a street name) is configured on port A5 and later another type/value pair of 6 Pacific is configured on the same port, Pacific replaces Atlantic in the civic address location configured for port A5.

### ELIN-Addr

This feature is intended for use in ECS applications to support class 3 LLDP-MED VoIP telephones connected to a switch in an MLTS infrastructure.

An **ELIN** is a valid NANP format telephone number assigned to MLTS operators in North America by the appropriate authority. The ELIN is used to route emergency (E911) calls to a PSAP.

(Range: 1-15 numeric characters)
Configuring coordinate-based locations

Latitude, longitude, and altitude data can be configured per switch port using an SNMP management application. For more information, see the documentation provided with the application. A further source of information on this topic is RFC 3825-Dynamic host configuration protocol option for coordinate-based location configuration information.

**NOTE:** Endpoint use of data from a medPortLocation TLV sent by the switch is device-dependent. See the documentation provided with the endpoint device.

**Table 22: Some location codes used in CA-TYPE fields**

<table>
<thead>
<tr>
<th>Location element</th>
<th>Code¹</th>
<th>Location element</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>national subdivision</td>
<td>1</td>
<td>street number</td>
<td>19</td>
</tr>
<tr>
<td>regional subdivision</td>
<td>2</td>
<td>additional location data</td>
<td>22</td>
</tr>
<tr>
<td>city or township</td>
<td>3</td>
<td>unit or apartment</td>
<td>26</td>
</tr>
<tr>
<td>city subdivision</td>
<td>4</td>
<td>floor</td>
<td>27</td>
</tr>
<tr>
<td>street</td>
<td>6</td>
<td>room number</td>
<td>28</td>
</tr>
<tr>
<td>street suffix</td>
<td>18</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

¹ The code assignments in this table are examples from a work-in-progress (the internet draft titled "Dynamic Host Configuration Protocol (DHCPv4 and DHCPv6) Option for Civic Addresses Configuration Information draft-ietf-geopriv-dhcp-civil-06" dated May 30, 2005.) For the actual codes to use, contact the PSAP or other authority responsible for specifying the civic addressing data standard for your network.

**Example:**

Suppose a system operator wants to configure the following information as the civic address for a telephone connected to her company’s network through port A2 of a switch at the following location:

<table>
<thead>
<tr>
<th>CA-type</th>
<th>CA-type</th>
<th>CA-VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>national subdivision</td>
<td>1</td>
<td>CA</td>
</tr>
<tr>
<td>city</td>
<td>3</td>
<td>Widgitville</td>
</tr>
<tr>
<td>street</td>
<td>6</td>
<td>Main</td>
</tr>
<tr>
<td>street number</td>
<td>19</td>
<td>1433</td>

  Ca-Length : 4
  Ca-Value : N4-3

Viewing switch information available for outbound advertisements

Syntax:

show lldp info local-device [port-list]

Without the [port-list] option, displays the global switch information and the per-port information currently available for populating outbound LLDP advertisements.

With the [port-list] option, displays only the following port-specific information that is currently available for outbound LLDP advertisements on the specified ports:

- PortType
- PortId
- PortDesc

NOTE: This command displays the information available on the switch. Use the lldp config <port-list> command to change the selection of information that is included in actual outbound advertisements. In the default LLDP configuration, all information displayed by this command is transmitted in outbound advertisements.

In the default configuration, the switch information currently available for outbound LLDP advertisements appears similar to the display in the following example.
Displaying the global and per-port information available for outbound advertisements

```
switch(config)# show lldp info local-device
```

LLDP Local Device Information

- **Chassis Type**: mac-address
- **Chassis Id**: 00 23 47 4b 68 DD
- **System Name**: Switch1
- **System Description**: J9091A Switch 3500yl, revision XX.15.06...
- **System Capabilities Supported**: bridge
- **System Capabilities Enabled**: bridge

**Management Address**

- **Type**: ipv4
- **Address**: 

**LLDP Port Information**

<table>
<thead>
<tr>
<th>Port</th>
<th>PortType</th>
<th>PortId</th>
<th>PortDesc</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>local</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>local</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>local</td>
<td>3</td>
<td>3</td>

<tr>
<td>4</td>
<td>local</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>local</td>
<td>5</td>
<td>5</td>
</tr>
</tbody>
</table>

1

The Management Address field displays only the LLDP-configurable IP addresses on the switch. (Only manually-configured IP addresses are LLDP-configurable.) If the switch has only an IP address from a DHCP or Bootp server, then the Management Address field is empty (because there are no LLDP-configurable IP addresses available.

---

The default per-port information content for ports 1 and 2

```
switch(config)# show lldp info local 1-2
```

**LLDP Local Port Information Detail**

- **Port**: 1
- **PortType**: local
- **PortId**: 1
- **PortDesc**: 1

```
----------------------------------------
Port     : 2
PortType : local
PortId   : 2
PortDesc : 2
```

Displaying the current port speed and duplex configuration on a switch port

You can compare port speed and duplex information for a switch port and a connected LLDP-MED endpoint for configuration mismatches by using an SNMP application. You can also use the switch CLI to display this information, if necessary. The `show interfaces brief <port-list>` and `show lldp info remote-device [port-list]` commands provide methods for displaying speed and duplex information for switch ports. For information on displaying the currently configured port speed and duplex on an LLDP-MED endpoint, see Viewing the current port speed and duplex configuration on a switch port on page 233.
Viewing the current port speed and duplex configuration on a switch port

Syntax:

```
show interfaces brief <port-list>
```

Includes port speed and duplex configuration in the Mode column of the resulting display.

Viewing advertisements currently in the neighbors MIB

Syntax:

```
show lldp info remote-device [port-list]
```

Without the [port-list] option, provides a global list of the individual devices it has detected by reading LLDP advertisements. Discovered devices are listed by the inbound port on which they were discovered.

**Multiple devices** listed for a single port indicates that such devices are connected to the switch through a hub.

**Discovering the same device on multiple ports** indicates that the remote device may be connected to the switch in one of the following ways:

- Through different VLANS using separate links. (This applies to switches that use the same MAC address for all configured VLANS.)
- Through different links in the same trunk.
- Through different links using the same VLAN. (In this case, spanning-tree should be invoked to prevent a network topology loop. Note that LLDP packets travel on links that spanning-tree blocks for other traffic types.)

With the [port-list] option, provides a listing of the LLDP data that the switch has detected in advertisements received on the specified ports.

For descriptions of the various types of information displayed by these commands, see Data available for basic LLDP advertisements.

---

**A global listing of discovered devices**

```
switch(config)# show lldp info remote
```

### LLDP Remote Devices Information

Chapter 7 Configuring for Network Management Applications 233
System Capabilities Supported: bridge, telephone
System Capabilities Enabled: bridge, telephone

Remote Management Address

MED Information Detail
- EndpointClass: Class3
- Media Policy Vlan id: 10
- Media Policy Priority: 7
- Media Policy Dscp: 44
- Media Policy Tagged: False
- Poe Device Type: PD
- Power Requested: 47
- Power Source: Unknown
- Power Priority: High

1 Indicates the policy configured on the telephone. A configuration mismatch occurs if the supporting port is configured differently.

Displaying LLDP statistics

LLDP statistics are available on both a global and a per-port levels. Rebooting the switch resets the LLDP statistics counters to zero. Disabling the transmit and/or receive capability on a port “freezes” the related port counters at their current values.

Viewing LLDP statistics

For more information, see Displaying LLDP statistics on page 234.

Syntax:

show lldp stats [port-list]

The global LLDP statistics command displays an overview of neighbor detection activity on the switch, plus data on the number of frames sent, received, and discarded per-port.

The per-port LLDP statistics command enhances the list of per-port statistics provided by the global statistics command with some additional per-port LLDP statistics.

Global LLDP Counters:

<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor Entries List Last Updated</td>
<td>The elapsed time since a neighbor was last added or deleted.</td>
</tr>
<tr>
<td>New Neighbor Entries Count</td>
<td>The total of new LLDP neighbors detected since the last switch reboot. Disconnecting, and then reconnecting a neighbor increments this counter.</td>
</tr>
<tr>
<td>Neighbor Entries Deleted Count</td>
<td>The number of neighbor deletions from the MIB for AgeOut Count and forced drops for all ports. For example, if the admin status for port on a neighbor device changes from tx_rx or txonly to disabled or rxonly, the neighbor device sends a “shutdown” packet out the port and ceases transmitting LLDP frames out that port. The device receiving the shutdown packet deletes all information about the neighbor received on the applicable inbound port and increments the counter.</td>
</tr>
</tbody>
</table>

Table Continued
### Neighbor Entries Dropped Count
The number of valid LLDP neighbors the switch detected, but could not add. This can occur, for example, when a new neighbor is detected when the switch is already supporting the maximum number of neighbors. See [Neighbor maximum](#) on page 236.

### Neighbor Entries AgeOut Count
The number of LLDP neighbors dropped on all ports because of Time-to-Live expiring.

## Per-Port LLDP Counters:

<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumFramesRecvd</td>
<td>The total number of valid, inbound LLDP advertisements received from any neighbors on port-list. Where multiple neighbors are connected to a port through a hub, this value is the total number of LLDP advertisements received from all sources.</td>
</tr>
<tr>
<td>NumFramesSent</td>
<td>The total number of LLDP advertisements sent from port-list.</td>
</tr>
<tr>
<td>NumFramesDiscarded</td>
<td>The total number of inbound LLDP advertisements discarded by port-list. This can occur, for example, when a new neighbor is detected on the port, but the switch is already supporting the maximum number of neighbors. See <a href="#">Neighbor maximum</a> on page 236. This can also be an indication of advertisement formatting problems in the neighbor device.</td>
</tr>
<tr>
<td>Frames Invalid</td>
<td>The total number of invalid LLDP advertisements received on the port. An invalid advertisement can be caused by header formatting problems in the neighbor device.</td>
</tr>
<tr>
<td>TLVs Unrecognized</td>
<td>The total number of LLDP TLVs received on a port with a type value in the reserved range. This can be caused by a basic management TLV from a later LLDP version than the one currently running on the switch.</td>
</tr>
<tr>
<td>TLVs Discarded</td>
<td>The total number of LLDP TLVs discarded for any reason. In this case, the advertisement carrying the TLV may be accepted, but the individual TLV is not usable.</td>
</tr>
<tr>
<td>Neighbor Ageouts</td>
<td>The number of LLDP neighbors dropped on the port because of Time-to-Live expiring.</td>
</tr>
</tbody>
</table>

## Examples:

### A global LLDP statistics display

```
switch(config)# show lldp stats
LLDP Device Statistics
Neighbor Entries List Last Updated : 2 hours
New Neighbor Entries Count : 20
Neighbor Entries Deleted Count : 20
Neighbor Entries Dropped Count : 0
Neighbor Entries AgeOut Count : 20

Frames Received    : 7309
Frames Sent        : 7231
TLVs Unrecognized  : 0
TLVs Discarded     : 0
Neighbor Ageouts   : 0

LLDP Operating Notes

Neighbor maximum

The neighbors table in the switch supports as many neighbors as there are ports on the switch. The switch can support multiple neighbors connected through a hub on a given port, but if the switch neighbor maximum is reached, advertisements from additional neighbors on the same or other ports will not be stored in the neighbors table unless some existing neighbors time-out or are removed.

LLDP packet forwarding

An 802.1D-compliant switch does not forward LLDP packets, regardless of whether LLDP is globally enabled or disabled on the switch.

One IP address advertisement per port

LLDP advertises only one IP address per port, even if multiple IP addresses are configured by `lldp config port-list ipAddrEnable` on a given port.

802.1Q VLAN Information

LLDP packets do not include 802.1Q header information and are always handled as untagged packets.

Effect of 802.1X Operation

If 802.1X port security is enabled on a port, and a connected device is not authorized, LLDP packets are not transmitted or received on that port. Any neighbor data stored in the neighbor MIB for that port prior to the unauthorized device connection remains in the MIB until it ages out. If an unauthorized device later becomes authorized, LLDP transmit and receive operation resumes.

Neighbor data can remain in the neighbor database after the neighbor is disconnected

After disconnecting a neighbor LLDP device from the switch, the neighbor can continue to appear in the switch’s neighbor database for an extended period if the neighbor’s `holdtime-multiplier` is high; especially if the
refresh-interval is large. See Changing the time-to-live for transmitted advertisements (CLI) on page 214.

**Mandatory TLVs**

All mandatory TLVs required for LLDP operation are also mandatory for LLDP-MED operation.

**LLDP and CDP data management**

This section describes points to note regarding LLDP and CDP (Cisco Discovery Protocol) data received by the switch from other devices. LLDP operation includes both transmitting LLDP packets to neighbor devices and reading LLDP packets received from neighbor devices. CDP operation is limited to reading incoming CDP packets from neighbor devices. (Switches do not generate CDP packets.)

Incoming CDP and LLDP packets tagged for VLAN 1 are processed even if VLAN 1 does not contain any ports. VLAN 1 must be present, but it is typically present as the default VLAN for the switch.

**NOTE:** The switch may pick up CDP and LLDP multicast packets from VLAN 1 even when CDP- and/or LLDP-enabled ports are not members of VLAN 1.

**LLDP and CDP neighbor data**

With both LLDP and (read-only) CDP enabled on a switch port, the port can read both LLDP and CDP advertisements, and stores the data from both types of advertisements in its neighbor database. (The switch stores only CDP data that has a corresponding field in the LLDP neighbor database.) The neighbor database itself can be read by either LLDP or CDP methods or by using the `show lldp` commands. Take note of the following rules and conditions:

- If the switch receives both LLDP and CDP advertisements on the same port from the same neighbor, the switch stores this information as two separate entries if the advertisements have different chassis ID and port ID information.
- If the chassis and port ID information are the same, the switch stores this information as a single entry. That is, LLDP data overwrites the corresponding CDP data in the neighbor database if the chassis and port ID information in the LLDP and CDP advertisements received from the same device is the same.
- Data read from a CDP packet does not support some LLDP fields, such as "System Descr," "SystemCapSupported," and "ChassisType." For such fields, LLDP assigns relevant default values. Also:
  - The LLDP "System Descr" field maps to CDP's "Version" and "Platform" fields.
  - The switch assigns "ChassisType" and "PortType" fields as "local" for both the LLDP and the CDP advertisements it receives.
  - Both LLDP and CDP support the "System Capability" TLV. However, LLDP differentiates between what a device is capable of supporting and what it is actually supporting, and separates the two types of information into subelements of the System Capability TLV. CDP has only a single field for this data. Thus, when CDP System Capability data is mapped to LLDP, the same value appears in both LLDP System Capability fields.
  - System Name and Port Descr are not communicated by CDP, and thus are not included in the switch’s Neighbors database.

**NOTE:** Because switches do not generate CDP packets, they are not represented in the CDP data collected by any neighbor devices running CDP.

A switch with CDP disabled forwards the CDP packets it receives from other devices, but does not store the CDP information from these packets in its own MIB.
LLDP data transmission/collection and CDP data collection are both enabled in the switch's default configuration. In this state, an SNMP network management application designed to discover devices running either CDP or LLDP can retrieve neighbor information from the switch regardless of whether LLDP or CDP is used to collect the device-specific information.

<table>
<thead>
<tr>
<th>Protocol state</th>
<th>Packet generation</th>
<th>Inbound data management</th>
<th>Inbound packet forwarding</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>LLDP Disabled</td>
<td>No packet generation.</td>
<td>No storage of LLDP data from neighbor devices.</td>
<td>No forwarding of inbound LLDP packets.</td>
</tr>
</tbody>
</table>

**CDP operation and commands**

By default the switches have CDP enabled on each port. This is a read-only capability, meaning that the switch can receive and store information about adjacent CDP devices but does not generate CDP packets.

When a CDP-enabled switch receives a CDP packet from another CDP device, it enters that device's data in the CDP Neighbors table, along with the port number where the data was received—and does not forward the packet. The switch also periodically purges the table of any entries that have expired. (The hold time for any data entry in the switch's CDP Neighbors table is configured in the device transmitting the CDP packet and cannot be controlled in the switch receiving the packet.) A switch reviews the list of CDP neighbor entries every three seconds and purges any expired entries.

**NOTE:**

For details on how to use an SNMP utility to retrieve information from the switch's CDP Neighbors table maintained in the switch's MIB, see the documentation provided with the particular SNMP utility.

**Viewing the current CDP configuration of the switch**

CDP is shown as enabled/disabled both globally on the switch and on a per-port basis.

**Syntax:**

```
show cdp
```

Lists the global and per-port CDP configuration of the switch.

The following example shows the default CDP configuration.

```
Default CDP configuration

switch(config)# show cdp
Global CDP information
```
Enable CDP [Yes] : Yes (Receive Only)

Port CDP
----- ------
1    enabled
2    enabled
3    enabled

Viewing the current CDP neighbors table of the switch

Devices are listed by the port on which they were detected.

Syntax:

show cdp neighbors

Lists the neighboring CDP devices the switch detects, with a subset of the information collected from the device's CDP packet.

[[e] port-numb [detail]]

Lists the CDP device connected to the specified port. (Allows only one port at a time.) Using detail provides a longer list of details on the CDP device the switch detects on the specified port.

(detail [[e] port-numb]]

Provides a list of the details for all of the CDP devices the switch detects. Using port-num produces a list of details for the selected port.

The following example displays the CDP devices that the switch has detected by receiving their CDP packets.

CDP neighbors table listing

switch(config)# show cdp neighbors

Enabling and Disabling CDP Operation

Enabling CDP operation (the default) on the switch causes the switch to add entries to its CDP Neighbors table for any CDP packets it receives from other neighboring CDP devices.

Disabling CDP operation clears the switch's CDP Neighbors table and causes the switch to drop inbound CDP packets from other devices without entering the data in the CDP Neighbors table.

Syntax:

[no] cdp run
Enables or disables CDP read-only operation on the switch.
(Default: Enabled)

Example:
To disable CDP read-only on the switch:
```
switch(config)# no cdp run
```

When CDP is disabled:
- `show cdp neighbors`
displays an empty CDP Neighbors table
- `show cdp`
displays Global CDP information
Enable CDP [Yes]: No

Enabling or disabling CDP operation on individual ports

In the factory-default configuration, the switch has all ports enabled to receive CDP packets. Disabling CDP on a port causes it to drop inbound CDP packets without recording their data in the CDP Neighbors table.

Syntax:
```
[no] cdp enable {< [e] port-list >}
```

Example:
To disable CDP on port A1:
```
switch(config)# no cdp enable a1
```

Configuring CDPv2 for voice transmission

Legacy Cisco VOIP phones only support manual configuration or using CDPv2 for voice VLAN auto-configuration. LLDP-MED is not supported. CDPv2 exchanges information such as software version, device capabilities, and voice VLAN information between directly connected devices such as a VOIP phone and a switch.

When the Cisco VOIP phone boots up (or sometimes periodically), it queries the switch and advertises information about itself using CDPv2. The switch receives the VOIP VLAN Query TLV (type 0x0f) from the phone and then immediately sends the voice VLAN ID in a reply packet to the phone using the VLAN Reply TLV (type 0x0e). The phone then begins tagging all packets with the advertised voice VLAN ID.

**NOTE:** A voice VLAN must be configured before the voice VLAN can be advertised. For example, to configure VLAN 10 as a voice VLAN tagged for ports 1 through 10, enter these commands:
```
switch(config)# vlan 10
switch(vlan-10)# tagged 1-10
switch(vlan-10)# voice
switch(vlan-10)# exit
```

The switch CDP packet includes these TLVs:
- CDP Version: 2
- CDP TTL: 180 seconds
- Checksum
- Capabilities (type 0x04): 0x0008 (is a switch)
- Native VLAN: The PVID of the port
• VOIP VLAN Reply (type 0xe): voice VLAN ID (same as advertised by LLDP-MED)
• Trust Bitmap (type 0x12): 0x00
• Untrusted port COS (type 0x13): 0x00

CDP should be enabled and running on the interfaces to which the phones are connected. Use the `cdp enable` and `cdp run` commands.

The `pre-standard-voice` option for the `cdp mode` command allows the configuration of CDP mode so that it responds to received CDP queries from a VoIP phone.

Syntax:

```plaintext
[no] cdp mode pre-standard-voice [admin-status < port-list > [tx_rx | rxonly]]
```

Enable CDP-compatible voice VLAN discovery with pre-standard VoIP phones. In this mode, when a CDP VoIP VLAN query is received on a port from pre-standard phones, the switch replies back with a CDP packet that contains the VID of the voice VLAN associated with that port.

**NOTE:** Not recommended for phones that support LLDP-MED.

<table>
<thead>
<tr>
<th>pre-standard-voice</th>
<th>Enables CDP-compatible voice VLAN discovery with pre-standard VoIP phones.</th>

hostname “Switch”
module 1 type J9307A
cdp mode pre-standard-voice admin-status A5 RxOnly
```

Filtering CDP information

In some environments it is desirable to be able to configure a switch to handle CDP packets by filtering out the MAC address learns from untagged VLAN traffic from IP phones. This means that normal protocol processing occurs for the packets, but the addresses associated with these packets is not learned or reported by the software address management components. This enhancement also filters out the MAC address learns from LLDP and 802.1x EAPOL packets on untagged VLANs.

The feature is configured per-port.

Configuring the switch to filter untagged traffic

Enter this command to configure the switch not to learn CDP, LLDP, or EAPOL traffic for a set of interfaces.

**Syntax:**

```
[no] ignore-untagged-mac <port-list>
```

Prevents MAC addresses from being learned on the specified ports when the VLAN is untagged and the destination MAC address is one of the following:

- 01000C-CCCCCC (CDP)
- 0180c2- 00000e (LLDP)
- 0180c2-000003 (EAPOL)
Configuring the switch to ignore packet MAC address learns for an untagged VLAN

switch(config) ignore-untagged-mac 1-2

Displaying the configuration

Enter the show running-config command to display information about the configuration.

Configuration showing interfaces to ignore packet MAC address learns

switch(config) show running-config

Running configuration:

; J9627 Configuration Editor; Created on release XX.15.XX
; Ver #03:03.1f.ef:f0
hostname “Switch”
interface 1
  ignore-untagged-mac
  exit
interface 2
  ignore-untagged-mac
  exit
.. ..
vlan 1
  name “DEFAULT_VLAN”
  untagged 1-24
  ip address dhcp-bootp
  exit
.. ..

Filtering PVID mismatch log messages

This enhancement filters out PVID mismatch log messages on a per-port basis. PVID mismatches are logged when there is a difference in the PVID advertised by a neighboring switch and the PVID of the switch port which receives the LLDP advertisement. Logging is an LLDP feature that allows detection of possible VLAN leakage between adjacent switches. However, if these events are logged too frequently, they can overwhelm the log buffer and push relevant logging data out of log memory, making it difficult to troubleshoot another issue.

Logging is disabled and enabled with the support of CLI commands.

This enhancement also includes displaying the Mac-Address in the PVID mismatch log message when the port ID is Mac-Address instead of displaying garbage characters in the peer device port ID field.

Use the following command to disable the logging of the PVID mismatch log messages:

**Syntax:**

logging filter [filter-name][sub filter id] <regularexpression> deny

**Regular-expression**

The regular expression should match the message which is to be filtered.
Syntax:

logging filter [filter-name] enable

Overview

A command has been written to suppress the IPv4 / IPv6 management address transmission in outgoing LLDP packets.

A local LAN device transmits organization-specific information in the form of type, length, and value (TLV). The organization-associated values are stored in the LLDP organizationally defined local device LLDP MIB extensions. Management address TLV in IPv4 and IPv6 environments is optional from the TLV basic management set.

TLV basic management set

- Port description TLV — Describes the port in an alpha-numeric format. The value equals the `ifDescr` object, if the LAN device supports RFC 2863.
- System name TLV — Assigns the system name in an alpha-numeric format. The value equals the `sysName` object, if the LAN device supports RFC 3418.
- System description TLV — Describes the network entity in an alpha-numeric format. The system description TLV includes the system name, versions of hardware, operating system, and networking software supported in the device. The value equals the `sysDescr` object, if the LAN device supports RFC 3418.
- System capabilities TLV — Indicates primary functions of the device and if they are enabled in the device.
- Management address TLV — Indicates the addresses of the local LLDP agent. Other remote managers can use this address to obtain information related to the local device.

The command `lldp config <all> ipAddrEnable <IP_ADDR>` is used to advertise specific IP address through the port.

The command `[no] lldp config <PORT NO> basicTlvEnable management_addr` suppresses the IP address to be advertised.

Commands

-[no] lldp config basicTlvEnable management_addr

Syntax

In the configure context:

-[no] lldp config <PORT_NUM> basicTlvEnable management_addr

Description

The feature suppresses the IPv4 or IPv6 address as well as suppresses the MAC address if the `[no] ip address` is configured. By default this management address TLV is enabled in switch. No other TLV (except management address TLV) suppression will occur when this command is used.

Parameters

Management_addr
- Management TLV

Example
lldp config

Syntax
lldp config <port-number>

Description
Configure the lldp for the desired port by number.

Parameter
basicTlvEnable

   Enables the basic advertised TLV for each port by number.

Options
<management_addr>

   Use the option <management_addr> to specify specific devices to enable TLV advertisement.

Usage
lldp config <port_num> basicTlvEnable <management_addr>

Show commands

Use the command show running-config to view the lldp configuration.

Example

switch# show running-config

Running configuration:
...
no lldp config 1 basicTlvEnable management_addr

Example

switch# show lldp config 1

   IpAddress Advertised:
Overview

The Dynamic Host Configuration Protocol (DHCP) is a network protocol that enables a server to automate assignment of IP addresses to hosts. A DHCP server can be configured to provide other network information like IP addresses of TFTP servers, DNS server, boot file name and vendor specific options. Commonly there are two types of address assignments, dynamic and manual. The lease of dynamic addresses is renewed periodically; manual leases are permanently assigned to hosts. With this feature, you can configure multiple pools of IP addresses for IP address assignment and tracking.

IP pools

A DHCP server is configured with IP pools. The server is then instructed to use IP addresses falling into the specified range of IP while offering leases. Multiple IP pools are configured to not have duplicate or overlapping IP subnets. You can also configure a DHCP server with multiple IP ranges within an IP subnet; this confines the allocatable IP addresses within the configured IP pool.

An IP pool will be claimed valid only if it is either:

- Dynamic pool – Has a network address, subnet mask and IP range(s)
- Static pool – Should have a static IP-to-MAC binding.

The DHCP server will discard the invalid and incomplete pools and will only operate on the valid IP pools. The DHCP server will require at least one valid pool to start.

DHCP options

On a DHCP server, an IP pool is configured with various options. These options signify additional information about the network. Options are supported with explicit commands such as boot-file. Option codes that correspond to explicit commands can not be configured with a generic option command; the generic option command requires an option code and TLV.

NOTE:

RFC 2132 defines various network information that a client may request when trying to get the lease.

BootP support

The DHCP server also functions as BootP server. A manual binding configured in a static IP Pool may either service a BootP client request or a DHCP client request.

Authoritative server and support for DHCP inform packets

The server message DHCPinform may be received when the server is already configured for static IPv4 addresses so that the server can get configuration parameters dynamically.

NOTE: RFC 2131 states that if a client has obtained a network address through some other means (e.g., manual configuration), it may use a DHCPinform request message to obtain other local configuration parameters. Servers receiving a DHCPinform message construct a DHCPACK message with any local configuration parameters appropriate for the client without: allocating a new address, checking for an existing binding, filling in yiaddr or including lease time parameters.
Authoritative pools

To process the DHCPINFORM packets received from a client within the given IP pool, a DHCP server has to be configured as authoritative for that IP pool. The server is the sole authority for this IP pool so when a client requests an IP address lease where the server is authoritative, and the server has no record of that IP address, the server will respond with DHCPNAK message which indicates that the client should no longer use that IP address. Any DHCPINFORM packet received for a non-authoritative pool will be ignored by the DHCP server.

The authoritative command has no effect when configured on a static pool or an incomplete pool without a network statement. In such cases, the server intentionally not send an error message.

A CLI toggle is provided under the pool context that will allow the authoritative configuration.

NOTE: The authoritative command requires a network statement to be configured on a pool.

Authoritative dummy pools

A dummy pool, without the range statement, can be configured and made authoritative. A dummy pool allows static-bind entries which do not have matching dynamic pools with network statements to be configured. By creating a dummy pool on a DHCP server, the support for DHCPinform packets will not be actively serving the client on this pool. No active leases or resource consumption will be sent to the DHCP server when this option is used.

Dummy pools help the DHCP server learn the network topology.

Example

dhcp-server pool dummy192
network 192.168.10.0 255.255.255.255
option 1...
option 2...
;
option n...
authoritative
exit

Change in server behavior

Making the server authoritative for an IP pool changes how the server processes DHCP REQUEST packets.

The following table exhibits the behavior on the receiving DHCP REQUEST and DHCP inform packets from DHCP clients residing on either authoritative and non-authoritative pools.
## DHCPv4 configuration commands

### DHCPv4 server

**dhcp-server**

**Syntax**

```
[no] dhcp-server [enable | disable]
```

**Description**

Use this command to enable/disable the DHCPv4 server in a switch. Defaults to disabled.

**Parameters and options**

- `no`
  - Removes all DHCPv4 server configurations.

- `enable`
  - Enables the DHCPv4 server on the device. The `no` form of this command

- `disable`
  - Disables the DHCPv4 server on the device.

### DHCP address pool name

**dhcp-server pool**

**Syntax**

```
[no] dhcp-server pool <POOL-NAME>
```

**Description**

Configure the DHCPv4 server IP address pool with either a static IP or a network IP range.

**Parameters and options**

---

### Table 23: Authoritative and non-authoritative pools

<table>
<thead>
<tr>
<th>Authoritative Pool</th>
<th>Non-authoritative pool</th>
</tr>
</thead>
<tbody>
<tr>
<td>When a DHCP client sending..</td>
<td>For Own IP</td>
</tr>
<tr>
<td>DHCP INFORM</td>
<td>send ACK</td>
</tr>
<tr>
<td>DHCP REQUEST</td>
<td>send ACK</td>
</tr>
</tbody>
</table>
pool
DHCPv4 server IP address pool.

ASCII-STR
Enter an ASCII string.

authoritative
Configure the DHCP server authoritative for a pool.

bootfile-name
Specify the boot file name which is used as a boot image.

default-router
List of IP addresses of the default routers.

dns-server
List of IP addresses of the DNS servers.

domain-name
Configure the DNS (Domain Name System) domain name for translation of hostnames to IP addresses.

lease
Lease period of an IP address.

netbios-name-server
List of IP addresses of the NetBIOS (WINS) name servers.

netbios-node-type
NetBIOS node type for a Microsoft DHCPv4 client.

network
Subnet IP and mask of the DHCPv4 server address pool.

option
Raw DHCPv4 server options.

range
Range of IP addresses for the DHCPv4 server address pool.

static-bind
Static binding information for the DHCPv4 server address pool.

tftp-server
Configure a TFTP server for the DHCPv4 server address pool.

Validations

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring pool when maximum Number of pools already configured.</td>
<td>Maximum number of pools (128) has already been reached</td>
</tr>
<tr>
<td>Configuring Pool with a name that exceeds the maximum length requirement.</td>
<td>String %s too long. Allowed length is 32 characters.</td>
</tr>
</tbody>
</table>

Table Continued
Trying to delete non existing pool

The specified address pool does not exist.

Only alphanumeric characters, numerals and underscore is allowed in the pool name. Violating this would throw the following error message.

Invalid name. Only alphanumeric characters and hyphen are allowed.

Trying to delete existing pool or adding new pool when DHCP server enabled.

DHCP server should be disabled before changing the configuration.

**Authoritative**

**Syntax**

```
[no] authoritative
```

**Description**

The DHCP server is the sole authority for the network configured under this pool. When the DHCP server is configured as authoritative, the server will respond with DHCP ACK or NACK as appropriate for all the received DHCP REQUEST and DHCP INFORM packets belonging to the subnet.

Non-authoritative DHCP INFORM packets received from the clients on a non-authoritative pool will be ignored.

**Parameters and options**

- `authoritative`

  Configure the DHCP server authoritative for a pool.

**DHCP client boot file**

**bootfile-name**

**Syntax**

```
[no] bootfile-name <FILENAME>
```

**Description**

Specify the boot file name to be used as the boot image.

**DHCP client default router**

**default-router**

**Syntax**

```
[no] default-router <IP-ADDR-STR> [IP-ADDR2 IP-ADDR8]
```

**Description**

Configure the DHCP pool context to the default router for a DHCP client. List all of the IP addresses of the default routers.

Two IP addresses must be separated by a comma.

Maximum of eight default routers can be configured.

**DNS IP servers**
**dns-server**

**Syntax**

[no] dns-server <IP-ADDR> [IP-ADDR2 IP-ADDR8]

**Description**

Configure the DHCP pool context to the DNS IP servers that are available to a DHCP client. List of IP addresses of the DNS servers.

Two IP addresses must be separated by comma.

Maximum of eight DNS servers can be configured.

---

**Configure a domain name**

**domain-name**

**Syntax**

[no] domain-name <NAME>

**Description**

Configure the DNS domain name for translation of hostnames to IP addresses.

---

**Configure lease time**

**lease**

**Syntax**

[no] lease [DD:HH:MM | infinite]

**Description**

Configure the lease time for an IP address in the DHCP pool. Lease time is infinite for static pools.

The default lease period is one day.

**Parameters and options**

**DD:HH:MM**

Enter lease period.

**Lease**

Lease period of an IP address.

---

**NetBIOS WINS servers**

**Syntax**

[no] netbios-name-server <IP-ADDR-STR> [IP-ADDR2 IP-ADDR8]

**Description**

Configure the DHCP pool for the NetBIOS WINS servers that are available to a Microsoft DHCP client. List all IP addresses of the NetBIOS(WINS) name servers. The Windows Internet Naming Service (WINS) is a name resolution service that Microsoft DHCP clients use to correlate host names to IP addresses within a general grouping of networks.

Two IP addresses must be separated by a comma.
Maximum of 8 NetBIOS (WINS) name servers can be configured.

**NetBIOS node type**

`net bios-ode-type`

**Syntax**

```
[no] netbios-node-type [ broadcast | hybrid | mixed | peer-to-peer ]
```

**Description**

Configure the DHCP pool mode to the NetBIOS node type for a Microsoft DHCP. The NetBIOS node type for Microsoft DHCP clients can be one of four settings: broadcast, peer-to-peer, mixed, or hybrid.

**Parameters and options**

- **broadcast**
  
  Broadcast node.

- **hybrid**
  
  Hybrid node.

- **mixed**
  
  Mixed node.

- **peer-to-peer**
  
  Peer to peer node.

**Subnet and mask**

`network`

**Syntax**

```
[no] network <ip-addr/mask-length>
```

**Description**

Configure the DHCPv4 server pool subnet and mask for the DHCP server address pool.

Range is configured to enable pool.

**Parameters and options**

- **ip-addr/mask-length**
  
  Interface IP address/mask.

**DHCP server options**

**Configure DHCP server options**

**Syntax**

```
[no] option <CODE> {ascii <ascii-string>|hex <hex-string>|ip <IP-ADDR-STR>[IP-ADDR2 ... IP-ADDR8]}
```

- **ascii**
  
  Specify ASCII string as option code value.
**hex**
Specify hexadecimal string as option code value.

**ip**
Specify one or more IP addresses as option code value.

**ip-addr-str**
Specify IP address.

**ascii-str**
Enter an ASCII string.

**hex-str**
Specify Hexadecimal string.

Configure the raw DHCP server options.

---

**NOTE:** Following DHCP options are not supported:
1,3,6,12,15,44,46,50,52,54,55,57,58,59,61,66,67,82.

You can use the following available CLIs for respective DHCP option codes:

<table>
<thead>
<tr>
<th>DHCP Option code</th>
<th>CLI Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>[no] network &lt;ip-addr/mask-length&gt;</td>
</tr>
<tr>
<td>3</td>
<td>[no] default-router &lt;IP-ADDR-STR&gt; [IP-ADDR2 ... IP-ADDR8]</td>
</tr>
<tr>
<td>6</td>
<td>[no] dns-server &lt;IP-ADDR&gt; [IP-ADDR2 ... IP-ADDR8]</td>
</tr>
<tr>
<td>15</td>
<td>[no] domain-name &lt;name&gt;</td>
</tr>
<tr>
<td>44</td>
<td>[no] netbios-name-server &lt;IP-ADDR-STR&gt; [IP-ADDR2 ... IP-ADDR8]</td>
</tr>
<tr>
<td>43</td>
<td>[no] option 43 {ascii &lt;ascii-string&gt;</td>
</tr>
<tr>
<td>46</td>
<td>[no] netbios-node-type &lt;broadcast</td>
</tr>
<tr>
<td>60</td>
<td>[no] option 60 {ascii &lt;ascii-string&gt;</td>
</tr>
<tr>
<td>66</td>
<td>[no] tftp-server server-name &lt; ASCII-STR&gt;</td>
</tr>
<tr>
<td>67</td>
<td>[no] bootfile-name&lt;filename&gt;</td>
</tr>
<tr>
<td>138</td>
<td>[no] option 138 {ascii &lt;ascii-string&gt;</td>
</tr>
<tr>
<td>150</td>
<td>[no] tftp-server server-ip &lt;ip-address&gt; or [no] option 150 &lt;IP-ADDR-STR&gt; [IP-ADDR2 ... IP-ADDR8]</td>
</tr>
</tbody>
</table>

**NOTE:** DHCP server raw Option 43 is supported and it is used for AirWave ZTP.

DHCP server raw Option 60 is supported from 16.06.

DHCP server raw Option 138 is supported and it is used for IPsec tunnel configuration in DHCP client.
IP address range

range
Syntax
[no] range <IP-ADDR>[<IP-ADDR>]

Description
Configure the DHCP pool to the range of IP address for the DHCP address pool.
Parameters and options
range
  Range of IP addresses for the DHCPv4 server address pool.
ip-addr
  Low IP address.
  High IP address.

Static bindings

static-bind
Syntax
static-bind ip <IP-ADDR/MASK-LENGTH> mac <MAC-ADDR>

Description
Configure static binding information for the DHCPv4 server address pool. Manual bindings are IP addresses that have been manually mapped to the MAC addresses of hosts that are found in the DHCP database. Manual bindings are just special address pools. There is no limit on the number of manual bindings but you can only configure one manual binding per host pool.
Parameters and options
ip
  Specify client IP address.
static-bind
  Static binding information for the DHCPv4 server address pool.
ip-addr / mask-length
  Interface IP address or mask.
mac
  Specify client MAC address.
mac-addr
  Enter a MAC address.

TFTP server domain name
**tftp-server**

**Syntax**

\[\text{no}] \text{tftp-server} \ [\text{server-name} \ <\text{server-name}> \ | \ \text{server-ip} \ <\text{ip-address}>]\n
**Description**

Configure the TFTP server domain name for the DHCP address pool.

**Parameters and options**

- **tftp-server**
  
  Configure a TFTP server for the DHCPv4 server address pool.

- **server-name**
  
  TFTP server name for the DHCPv4 server address pool.

**Configure the TFTP server address**

**tftp-server**

**Syntax**

\text{tftp-server} \ \text{server-ip} \ <\text{IP-ADDRESS}>\n
**Description**

Configure the TFTP server address for the DHCP address pool.

**Parameters and options**

- **server-ip**
  
  TFTP server IP addresses for the DHCPv4 server address pool.

- **ip-addr**
  
  Specify TFTP server IP address.

**Number of ping packets**

**dhcp-server ping**

**Syntax**

\[\text{no}] \text{dhcp-server ping} \ [\text{packets} \ <0-10>|\text{timeout} \ <0-10>]\n
**Description**

Specify, in the global configuration context, the number of ping packets the DHCP server will send to the pool address before assigning the address. The default is two packets.

**Parameters and options**

- **ping**
  
  Specify DHCPv4 ping parameters.

- **packets <0-10>**
  
  Specify number of ping packets in the range of 0 to 10. 0 disables ping.
timeout <1-10

Ping timeout in the range of 1–10 seconds. Indicates the amount of time the DHCPv4 server must wait before timing out a ping packet. Defaults to one second.

Save DHCP server automatic bindings

dhcp-server database

Syntax

[no] dhcp-server database [file ASCII-STR] [delay<15-86400>] [timeout <0-86400>]

Description

Specifies DHCPv4 database agent and the interval between database updates and database transfers.

Parameters and options

delay

Seconds to delay writing to the lease database file.

file

URL Format: "tftp://<ip-address>/<filename>".

database

Specifies DHCPv4 database agent and the interval between database updates and database transfers.

timeout

Seconds to wait for the transfer before failing.

ascii-str

Database URL.

<15-86400>

Delay in seconds.

<0-86400>

Timeout in seconds.

DHCP server and SNMP notifications

snmp-server enable traps

Syntax

[no] snmp-server enable traps dhcp-server

Description

Configure a DHCP server to send SNMP notifications to the SNMP entity. This command enables or disables event traps sent by the switch.

Parameters and options

dhcp-server

Traps for DHCP-Server.

Conflict logging on a DHCP server
**dhcp-server conflict-logging**

**Syntax**

[no] dhcp-server conflict-logging

**Description**

Enable conflict logging on a DHCP server. Default is disabled.

**Parameters and options**

conflict-logging

Enable DHCPv4 server address conflict logging.

---

**Enable the DHCP server on a VLAN**

**dhcp-server**

**Syntax**

dhcp-server

**Description**

Enable DHCPv4 server on a VLAN. DHCPv4 client or DHCPv4 relay cannot co-exist with DHCPv4 server on a VLAN.

**Parameters and options**

dhcp-server

Enable DHCPv4 server on a VLAN.

---

**Clear commands**

**clear dhcp-server conflicts**

**Syntax**

clear dhcp-server conflicts <IP-ADDR>

**Description**

Reset DHCPv4 server conflicts database. If IP address is specified, reset only that conflict.

**Parameters and options**

dhcp-server

Clears the DHCPv4 server information.

ip-addr

Specify the IP address whose conflict is to be cleared.

---

**Reset all DHCP server and BOOTP counters**

**clear dhcp-server statistics**

**Syntax**

clear dhcp-server statistics
Description
Reset all DHCP server and BOOTP counters

Parameters and options

statistics
Reset DHCPv4 server and BOOTP counters.

Delete an automatic address binding

clear dhcp-server statistics

Syntax
clear dhcp-server statistics

Description
Delete an automatic address binding from the DHCP server database.

Parameters and options

binding
Reset DHCPv4 server automatic address bindings.

ip-addr
Specify IP address of the binding is to be cleared.

Show commands

show dhcp-server

Syntax
show dhcp-server [binding|conflicts|database|statistics|pool <POOL-NAME>]

Description
Show DHCPv4 server global configuration information for the device.

Parameters and options

binding
Display the DHCPv4 server address bindings on the device.

conflicts
Display address conflicts found by a DHCPv4 server when addresses are offered by a client.

database
Display DHCPv4 server database agent information.

statistics
Display DHCPv4 server statistics.

pool <POOL-NAME>
Display the DHCPv4 server IP pool information.

Chapter 8 DHCPv4 server
DHCPv6 hardware address

The incremental deployment of IPv6 to existing IPv4 networks results in dual-stacking network environments. Some devices will act as both DHCPv4 and DHCPv6 clients. For these dual-stack situations, there is a need to associate DHCPv4 and DHCPv6 messages with the same client interface. A DHCPv4 server uses the client link-layer address as the customer identifier and a key for lookup in the client database. The DHCPv6 Relay-Forward message carries the client link-layer address to the DHCPv6 server allowing the association of both DHCPv4 and DHCPv6 messages with the same client interface.

As defined in RFC-6939, DHCPv6 relay agents receiving solicit and request messages that originate from DHCPv6 clients include the link-layer source address of the received DHCPv6 message. This is accomplished in the Client Link-Layer Address option within DHCPv6 Relay-Forward messages. The Client Link-Layer Address enables the server to recognize and service specific clients. DHCPv6 relay agent behavior (as set by the configuration) decides whether the Client Link-Layer Address option is included for each client.

DHCPv6 relays agents include Option–79 for all message types when enabled. The message types are: solicit, request, confirm, decline, renew, rebind, release and information-request. DHCPv6 provides additional information for event debugging and logging related to the client at the server.

NOTE:
All cascading relay-agents simply encapsulate the message received and relay-forward to the server. The service function does not receive any message-types directly from the client even when the feature is enabled.

DHCPv6 snooping and relay

Configuring DHCPv6 and DIPLDv6 through SNMP

NOTE: DHCPv6 snooping and Dynamic IPv6 Lockdown (DIPLDv6) are currently configurable through SNMP using MIBs. For more information, see the MIB and Trap Matrix.

dhcpv6–snooping

Syntax

[no] dhcpv6-snooping [vlan <VLAN-ID-RANGE>]

Description

Enable or disable the global administrative status of DHCPv6 snooping. You must enable DHCP snooping globally (dhcpv6-snooping) to enable snooping on any VLAN.

Parameters and options

no

Disabling global administrative status (no dhcpv6-snooping) disables snooping on all VLANs.

vlan <VLAN-ID-RANGE>

Disables snooping on a VLAN or a range of VLANs. Requires enabling DHCP global snooping (dhcpv6-snooping)
Validation rules for DHCPv6 global snooping

<tbody>
<tr>
<td>if the VLAN is a SVLAN and the bridge mode is mixed mode</td>
<td>DHCPv6-snooping is not supported on SVLANs and SVLAN ports in QinQ mixed VLAN mode</td>
</tr>
<tr>
<td>If number of snooped VLAN count is greater than max_vlans_with_dipv6ld and also the max binding limit has reached.</td>
<td>DHCPv6 snooping cannot be enabled on %s VLANs. The switch will support only 8 DHCPv6 snooping enabled VLANs when Dynamic IPv6 Lockdown feature is enabled.</td>
</tr>
<tr>
<td>If the VLAN which is being configured for DHCPv6 Snooping has a Smart Link enabled port.</td>
<td>Cannot configure DHCPv6 Snooping on a VLAN containing Smart Link ports.</td>
</tr>
<tr>
<td>If a VLAN is being configured as a Smart Link protected VLAN and DHCPv6 Snooping is enabled on it.</td>
<td>Cannot configure a VLAN as a protected VLAN when DHCPv6 Snooping is enabled on it.</td>
</tr>
<tr>
<td>If Smart Link is being configured on a port which is a part of DHCPv6 Snooping VLAN.</td>
<td>Cannot configure the Smart Link feature on a port when DHCPv6 Snooping is enabled on that port.</td>
</tr>
</tbody>
</table>

**dhcpv6 snooping trust**

**Syntax**

```
[no] dhcpv6-snooping trust ethernet <PORT-LIST>
```

**Description**

Configure trusted interfaces. The system forwards server packets received on trusted interfaces only.

**Parameters and options**

- **no**
  - Marks the specified interfaces as untrusted. Port state defaults to untrusted.

**Validation rules**
### Validation

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify whether the port exist in the device.</td>
<td>Module not present for port or invalid port: &lt;PORT-LIST&gt;</td>
</tr>
<tr>
<td>If the port is a part of a SVLAN and the bridge mode is mixed mode.</td>
<td>Port %s cannot be configured as trusted port as it is part of a SVLAN in QinQ mixed VLAN mode.</td>
</tr>
<tr>
<td>If the port is not a part of a dsnoopv6 enabled VLAN</td>
<td>Port %s is not a part of a DHCPv6-snooping VLAN.</td>
</tr>
<tr>
<td>If trusted attribute is being configured on a port on which max-binding has been already configured.</td>
<td>Disable max-binding feature configured on the port before configuring it as a trusted port.</td>
</tr>
<tr>
<td>If a Dynamic trunk is configured as a trusted port.</td>
<td>Cannot configure a port as a DHCPv6 Snooping trusted port when Dynamic Trunking is enabled on that port.</td>
</tr>
<tr>
<td>If a Smart Link port is being configured as a trusted port</td>
<td>Cannot configure a Smart Link port as a DHCPv6 Snooping trusted port.</td>
</tr>
<tr>
<td>If a trusted port is being configured as a Smart Link port</td>
<td>Cannot configure a DHCPv6 Snooping trusted port as a Smart Link port.</td>
</tr>
</tbody>
</table>

### dhcpv6–snooping authorized-server

**Syntax**

```
[no] dhcpv6-snooping authorized-server <IPV6-ADDRESS>
```

**Description**

Configure authorized DHCPv6 servers. For DHCPv6 snooping to allow a server to client packet to be forwarded, it must be received on a trusted port from an authorized server. If no authorized servers are configured, all server addresses are valid.

### ddhcpv6–snooping database file

**Syntax**

```
[no] dhcpv6-snooping database file [ASCII-STR|delay <15-86400>| timeout<0-86400>]
```

**Description**

Configure a lease entry file and its options for storing DHCPv6 snooping binding database.

**Parameters and options**

**ASCII-STR**

Copies the DHCPv6 snooping lease file to a TFTP server. The parameter ASCII-STR is a URL and is in the format tftp://<IP-ADDR>/<FILENAME>. The TFTP address can be up to 255 characters. IP-ADDR can be an IPv4 address or an IPv6 address. The IPv6 address must be enclosed in square brackets [].

**timeout seconds**

Configures the number of seconds to wait for the DSNOOPv6 lease file transfer to complete. An error message is displayed if the file transfer is not completed within the timeout value. A value of zero indicates
that the attempt to transfer the DHCPv6 lease file retries indefinitely. The default timeout value is 300 seconds.

database
Configure the parameters to copy the DHCPv6 Snooping lease file to a TFTP server.

delay
Configure the number of seconds to wait before copying the DSNOOPv6 lease file to a TFTP server.

file
Copy the DHCPv6 Snooping lease file to a TFTP server.

timeout
Configure the number of seconds to wait for the DSNOOPv6 lease file transfer to complete.

Validation rules

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify whether file name entered is in URL format</td>
<td>database: Bad URL format.</td>
</tr>
<tr>
<td>Verify whether the timeout value is within the limit</td>
<td>Invalid input: &lt;value&gt;</td>
</tr>
<tr>
<td>Verify whether the delay value is within the limit.</td>
<td>Invalid input: &lt;value&gt;</td>
</tr>
<tr>
<td>If the URL format is not proper</td>
<td>Bad URL format.</td>
</tr>
<tr>
<td>If the entered URL does not have a valid transfer mode.</td>
<td>URL Transport mode is not supported.</td>
</tr>
</tbody>
</table>

dhcpv6-snooping max-bindings

Syntax
[no] dhcpv6-snooping max-bindings <PORT-LIST 1-8192>

Description
Configure the maximum number of binding addresses allowed per binding anchor. A binding anchor is a unique attribute that can be associated with a client address.

Parameters and options
max-bindings
Configuring maximum number of binding addresses allowed per port.

• If the max-bindings value is configured before enabling dhcpv6-snooping the limit is immediately applied and the bindings are not allowed to exceed the max-bindings value.
• The max-bindings value is setafter enabling dhcpv6-snooping.
• The current bindings are greater than the max-binding value, the configuration will be applied as and when clients release their IPv6 addresses.
• Current bindings are lesser than that of the value entered, the configuration will be immediately applied.

<PORT-LIST 1-8192>
Specify the ports on which max-bindings need to be applied in the range of 1–8192.
Validation rules

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify max-bindings value entered is in the range</td>
<td>Invalid input: &lt;value&gt;</td>
</tr>
<tr>
<td>If DHCPv6-Snooping is already configured before entering the command and current bindings are greater than the value being set.</td>
<td>Existing bindings %d are more than the max-bindings being configured, and the maximum limit will be applied once the number of existing bindings fall below this limit</td>
</tr>
<tr>
<td>If the value is being configured for a trusted port</td>
<td>Cannot configure maximum binding for DHCPv6 snooping feature on a trusted port</td>
</tr>
<tr>
<td>If the value is being configured for a port which is not a part of a dhcpv6-snooped vlan</td>
<td>Port %s is not a part of a DHCPv6-snooping VLAN.</td>
</tr>
<tr>
<td>If the max-binding value is being set for a Dynamic trunk.</td>
<td>Cannot configure DHCPv6 Snooping on a port when Dynamic Trunking is enabled on that port.</td>
</tr>
<tr>
<td>If the number of static bindings is greater than the max-binding value being set.</td>
<td>Cannot configure the maximum binding value because the number of static bindings on the port exceeds the maximum binding value.</td>
</tr>
<tr>
<td>If a port on which max-binding is enabled is being put into a trunk.</td>
<td>Cannot add a port to a trunk group when DHCPv6 Snooping Maxbinding is configured on that port.</td>
</tr>
<tr>
<td>If a trunk has max-bindings configured on it. And the trunk is being removed.</td>
<td>Cannot remove the port %s from the trunk group because DHCPv6 Snooping max-binding is configured on the trunk and removing the port will delete the trunk.</td>
</tr>
<tr>
<td>If DT trunk is being configured on a max-binding enabled port.</td>
<td>Cannot configure Distributed Trunking on a port when DHCPv6 Snooping max-binding is configured on that port.</td>
</tr>
</tbody>
</table>

**IMPORTANT:** DT trunks can use jumbo VLAN as usual, but user needs to ensure that jumbo is configured on both the DT pairs, otherwise packet drops/fragmentations can be seen.

**dhcpv6-relay option 79**

**Syntax**

```shell
[no] dhcpv6-relay option 79
```

**Description**

Enabling option 79 will force the DHCPv6 Relay agent to forward the client Link-layer address. Defaults to disabled.

**snmp-server enable traps dhcpv6-snooping**

**Syntax**

```shell
[no] snmp-server enable traps dhcpv6-snooping [out-of-resources|errant-reply]
```
Description
Configure the traps for DHCPv6 snooping.

Parameters and options
out-of-resources
This trap is sent when the number of bindings exceed the maximum limit of 8192 bindings.

errant-reply
This trap is sent when a DHCPv6 reply packet is received on an untrusted port or from an un-authorized server.

clear dhcpv6–snooping stats
Syntax
clear dhcpv6-snooping stats
Description
Clears dhcpv6 snooping statistics.
Validation rules
<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>If dhcp-snooping not enabled globally</td>
<td>DHCPv6 snooping is disabled.</td>
</tr>
</tbody>
</table>

ddebug security dhcpv6–snooping
Syntax
ddebug security dhcpv6-snooping [config|event|packet]
Description
Enable debug for DHCPv6 snooping.
Parameters and options
config
Debug DHCPv6 snooping configuration.
event
Debug a DHCPv6 snooping event.
packet
Debug DHCPv6 snooping by packet.

ipv6 source-lockdown ethernet
Syntax
[no] ipv6 source-lockdown ethernet <PORT-LIST>
Description
Used to configure DIPv6LD lockdown globally and on specific ports which can be configured on per-port basis using the PORT-LIST option.
Parameters and options

[ethernet] PORT-LIST

Specify the ports being configured for IPv6 source-lockdown.

source-lockdown

Enable IPv6 source lockdown for a specific port.

Validation rules

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>

</tr>
</tbody>
</table>
**ipv6 source-binding**

**Syntax**

```
[no] ipv6 source-binding VLAN-ID IPV6-ADDR MAC-ADDR PORT-NUM IPV6-ADDR
```

**Description**

Add a DHCPv6 static binding entry into the binding table. Static binding entries will have infinite lifetime.

**Parameters and options**

**VLAN-ID**

The VLAN ID of the static binding entry.

**Ipv6-ADDRESS**

The Ipv6 address of the static binding entry.

**MAC-ADDRESS**

The MAC address of the static binding entry.

**[ethernet] PORT-NUM**

Port number of the static binding entry.

**IPV6-ADDR**

The Ipv6 link-local address of the static binding entry.

**Validation rules**

**snmp-server enable traps dyn-ipv6-lockdown**

**Syntax**

`[no] snmp-server enable traps dyn-ipv6-lockdown [out-of-resources | violations]`

**Description**

The Dynamic IPv6 Lockdown trap is sent when resources are unavailable for configuring. This trap is sent when a source lockdown violation takes place.

**Parameters and options**
out-of-resources
  Dynamic IPv6 Lockdown out of resources.
violations
  Dynamic IPv6 lockdown violations.

**debug security dynamic-ipv6-lockdown**

**Syntax**

```
debug security dynamic-ipv6-lockdown
```

**Description**

Enable debug for DIPLDv6

**Show commands for DHCPv6–snooping**

**show dhcpv6-snooping**

**Syntax**

```
show dhcpv6-snooping
```

**Description**

Show dhcpv6 snooping configuration.

**Validation rules**

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>If dhcpv6-snooping not enabled</td>
<td>DHCPv6 snooping is disabled</td>

</tbody>
</table>

**show dhcpv6 snooping bindings**

**Syntax**

```
show dhcpv6-snooping bindings
```

**Description**

Show dhcpv6 snooping binding entries. This would show both dynamic and static binding entries.

**Validation rules**

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>If dhcpv6-snooping not enabled</td>
<td>DHCPv6 snooping is disabled</td>
</tr>
</tbody>
</table>

**show dhcpv6 snooping statistics**

**Syntax**

```
show dhcpv6-snooping stats
```

**Description**

Show dhcpv6-snooping statistics.
**show ipv6 source-lockdown**

**Syntax**

show ipv6 source-lockdown [bindings | status]

**Description**

Shows IPv6 source bindings that are configured using the command IPv6 source-bindings.

**Parameters and options**

**bindings**

Show source bindings for Dynamic IPv6 Lockdown ports.

**status**

Show source bindings for Dynamic IPv6 Lockdown status.

---

**Show source bindings Dynamic IPv6 Lockdown status**

IPv6 Source Lockdown is disabled on Ports 3-24.
**show snmp-server traps**

**Syntax**

show snmp-server traps <COMMUNITY-STR>

**Description**

Shows traps controlled. Shows all information on SNMP communities, trap receivers and SNMP response or trap source-ip policy configured on the switch.

**Parameters and options**

traps

- Show all configured traps.

<COMMUNITY-STR>

- Displays information for the specified community only.

---

**Show snmp-server traps**

</table>
Aruba offers on-premise and cloud-based management solutions for switches, access points, and controllers. AirWave is an award-winning on-premise Network Management Solution (NMS) that manages both Aruba and third-party network devices. AirWave is ideal for Campus networks and for organizations which prefer to have complete control over the hardware and software and have their NMS within premises (for example: either in the head office or data center or one of the large campuses).

Aruba Central is a popular cloud-based management solution for Branch and Distributed Enterprises which prefer simplicity, programmability, and integration with third-party cloud-based solutions for automation. Central offers cloud portal subscriptions through which one can manage the entire network of Aruba devices, without having to set up, upgrade, scale, or manage an NMS.

In this chapter, the focus is primarily on the Zero Touch Provisioning (ZTP) and connection to either AirWave or Central using ZTP for check-in, configuration download, and management.

**Zero Touch Provisioning**

ZTP enables the auto-configuration of factory-default switches without requiring any manual setup process. It helps the administrators to deploy their fleet of switches at multiple branches without requiring a technical expert onsite. It is of use for distributed enterprises (for example: hotels, hospitals, retail stores, educational institutions, and other enterprises) where an administrator is not available at every site.

Aruba offers ZTP solution which reduces the overall cost of ownership. Aruba ships infrastructure devices such as switches, access points, and controllers directly to the site of usage. With ZTP, even a nontechnical user (for example: store manager in a retail chain or a class teacher in a school) can deploy devices at site. When the devices are connected to AirWave or Central, ZTP automatically sets up the required firmware and configurations, and services without the need for technical expertise on site.

**ZTP with AirWave**

Aruba supports ZTP using:

- DHCP servers for on-premise management and
- Activate for cloud-based management. Activate is a cloud-based inventory management and provisioning service.

You can choose any of the ZTP methods based on your requirement. For example: If all the campuses and branches which an Enterprise manages are reachable within a private network, Aruba recommends using DHCP-based ZTP. If an Enterprise network spans multiple campuses and branches using WAN to communicate, use Activate-based ZTP.

**DHCP-based ZTP with AirWave**

Switches can be connected to AirWave through IPv4 or IPv6 addresses. To enable IPv6 ZTP provisioning, the `ipv6 enable` and `ipv6 address dhcp full` will be enabled by default from 16.06 switch version. These commands also get enabled when the switch upgrades from any older images to 16.06 with factory default configuration. IPv6 based ZTP is supported from 16.06 switch version.

**Configuring DHCP-based ZTP with AirWave**

ZTP auto-configures your switches as follows:
NOTE:

- Activate based ZTP is not supported with IPv6.
- AirWave 8.2.6.1 supports IPv6 ZTP.

Procedure

1. The switch boots up with the factory default configuration.

2. The switch sends out a DHCP discovery from the primary VLAN interface.
   
a. The preferred configuration method uses DHCP option 43 value as a string to parse AirWave configuration. Switch would expect a DHCP option 60 with value `ArubaInstantAP` along with DHCP option 43 to parse AirWave details.
   
b. The alternative configuration method supports both encapsulated values from option 43 and direct value from option 43. Encapsulated vendor-specific sub options, with suboption code 146 is for AirWave details.

3. After the AirWave details are verified and configured, the switch initiates the check-in into the AirWave server using the HTTPS communication.

   NOTE: The AirWave configuration must be in the following format:
   `<Group>:<Topfolder>:<folder1>,<AMP IP >,<shared secret>`

4. After a successful registration, AirWave can monitor, configure, and troubleshoot the switches. Refer to *Aruba Networks and AirWave Switch Configuration Guide*.

5. Check-in failure retry is done every 60 seconds for 10 retries.

6. If DHCP does not provide Airwave details, the switch reaches out to Activate (Activate ZTP starts) for Airwave or Central details. If the DHCP options are not configured for AirWave, the switch is left in its default state for manual configuration.

In the preceding illustration, the workflow is as follows:
1. The switches being provisioned in the branches are booted obtaining the IP address from the DHCP server.
2. The DHCP servers provide information about the AirWave server in the Corporate Head Quarters.
3. The switches connect to the AirWave server through the Corporate Network (MPLS VPN or equivalent).
4. The AirWave server pushes the configuration to the switches based on the AirWave folder, switch model, and branch location.
5. An optional IPsec tunnel can be established between the branches and the Corporate HQ to secure the management traffic. For more information, refer the Activate-based ZTP with AirWave.

NOTE: If IPsec tunnel is required for AirWave, the switch requires Aruba Mobility Controller IP address, which is provided through ZTP with DHCP Option 138 (CAPWAP).

Limitations

- ZTP is not supported through OOBM.
- The HTTPS check-in to AirWave does not support HTTPS proxy.
- For non-ZTP cases, the AirWave check-in starts by validating the following condition: Primary or Management VLAN must be configured with the IP address and one of the interfaces must be UP. By default, VLAN 1 is the primary VLAN.
- OOBM redirection is not supported by VSF.

Best Practices

- Implement ZTP in a secure and private environment. Any public access may compromise the security of the switch, as follows:
  - Since ZTP is enabled only on the factory default configuration of the switch, DHCP snooping is not enabled. The Rogue DHCP server is to be manually managed.
  - The DHCP offer is in plain data without encryption. Therefore, the offer can be listened by any device on the network and they can in turn obtain the AirWave information.
  - The TLS certificate of the server is not validated by the switch during the HTTPS check-in to AirWave. The AirWave server must be hosted in a private and secure environment of the switch.

Configure AirWave details in DHCP (preferred method)

To configure a DHCP server for AirWave, from a Windows Server 2008, do the following steps:

Procedure

1. From the Start menu, select Server Manager.
2. Select Roles -> DHCP -> Server -> w2k8 -> IPv4.

3. Right-click IPv4 and select Set Predefined Options...
4. The Predefined Options and Values screen is displayed. Click **Add**.

![Predefined Options and Values](image)

**Predefined Options and Values**

- **Option class**: DHCP Standard Options
- **Option name**: 002 Time Offset
- **Description**: UTC offset in seconds
- **Value**: 0x0

5. Enter the desired **Name** (any), **Data type** (select **String**), **Code** (enter 60), and **Description** (any).
6. Click **OK**.

7. From the Predefined Options and Values screen, under Value, enter the String **ArubaInstantAP**. The string is case-sensitive and must be **ArubaInstantAP**.

8. Click **OK**.

9. Under IPv4, expand **Scope**. Right-click **Scope Options** and select **Configure Options**...
10. Under the General tab, select **043 Vendor Specific Info**. The Data entry data appears. Under ASCII, enter `hpeSwitch:hp2920,90.1.1.10, admin`. The ASCII value has the following format:

`<Group>:<Topfolder>,<AMP IP>,<shared secret>`

11. To add sub-folders, use the following format:

`<Group>:<Topfolder>:<folder1>,<AMP IP>,<shared secret>`

12. Under the General tab, select **060 AirWave**. Click **OK**.
NOTE: No changes are required to the 060 option.

13. You can verify the AirWave details as follows:

```
switch# show amp-server
switch# show run
```

Configure AirWave details in DHCP (alternative method)

To configure a DHCP server for ZTP and AirWave, from a Windows Server 2008, do the following steps:

NOTE: Use these steps to configure ZTP for every switch by selecting a different Vendor Class for each type of switch.

Procedure

1. From the Start menu, select Server Manager.
2. Select **Roles -> DHCP -> Server -> w2k8 -> IPv4**.

3. Right-click **IPv4** and select **Define Vendor Classes...**
4. The DHCP Vendor Classes window is displayed. Click **Add**.

5. To get the vendor-specific value of a switch, go to the switch console and enter:

   `switch# show dhcp client vendor-specific`

6. In our example, the command returns the following value: Processing of Vendor Specific Configuration is enabled

   `Vendor Class Id = J9729A 2920-24G-PoE+ Switch dslforum.org`
7. From the New Class window, enter the desired **Display name** (any) and the **Description** (any). For the **ASCII** field, enter the exact value that you got by executing the `show` command performed in the previous step. In this example, **Hewlett Packard Enterprise J9729A 2920-24G-PoE+ Switch dsiforum.org**.

8. Click **OK**.

9. Right-click **IPv4** and select **Set Predefined Options**...
10. From the Predefined Options and Values window, select **Option class**. The Option Class displayed is the one that you configured under **DHCP Vendor Class**. In this example, the Option Class is **switch**.

11. Click **Add...**

12. From the **Option Type** window, enter the desired **Class** (any), the **Data type** (select **string**), the **Code** (enter **146**), and the **Description** (any).
13. Click OK.

14. Under the Predefined Options and Values window, enter the Value String. In this example, we enter `hpeSwitch:hp2920,90.1.1.10, admin`. The String has the following format: `<Group>:<Topfolder>,<AMP IP>,<shared secret>

15. To add sub-folders, use the following format: `<Group>:<Topfolder>:<folder1>,<AMP IP>,<shared secret>`

16. Click OK.
17. Under **IPv4**, expand **Scope**. Right-click **Scope Options** and select **Configure Options...**

18. From the **Scope Options** window:
   
   a. Select the **Advanced** tab.
   
   b. Under Vendor class, select the desired switch. In this example, **switch**.
   
   c. Select the **146 switch** option.
   
   d. Click **OK**.
19. You can verify the AirWave details as follows:

```
switch# show amp-server
switch# show run
```

**Configure AirWave details manually**

This section focuses on configuring the switch manually to reach out to AirWave. Manual configuration may be required, if ZTP is disabled due to the following scenarios or if AirWave credentials are not provided during the DHCP offer:

- Switch with configuration that explicitly disables ZTP
- Switch with nondefault configuration
- Switches that have upgraded from older images to 16.xx

In any of the above scenarios, you need to manually configure to reach the AirWave server using the `amp-server` command. This command helps you configure the AirWave IP address, group, folder, and shared secret. You must have the `manager` role to execute this command.

For example:
switch(config)# amp-server ip 192.168.1.1 group "group" folder "folder" secret "branch1024"

The `show amp-server` command shows the configuration details:

AirWave Configuration details
AMP Server IP : 192.168.1.1
AMP Server Group : GROUP
AMP Server Folder : folder
AMP Server Secret : branch1024
AMP Server Config Status: Configured

```
amp-server

Syntax
amp-server ip <IP-ADDR | IPv6-ADDR> group <GROUP> folder <FOLDER> secret <SECRET>
no amp-server

Description
The `amp-server` command configures AirWave Management Platform (AMP) IP address, group, folder, and shared secret for triggering the device registration with AMP. The `amp-server` command supports both the IPv4 and IPv6 addresses. Switch cannot be provisioned simultaneously with IPv4 and IPv6 AirWave addresses.

NOTE: The `amp-server` with IPv6 address is supported from 16.06 switch version.

The `no` form of this command removes the configuration for the AMP server.

Command context
config

Parameters
IP-ADDR
  AMP server IPv4 address.
IPv6-ADDR
  AMP server IPv6 address.
GROUP
  AMP server group name.
FOLDER
  AMP server folder name.
SECRET
  AMP server shared secret string.

Example
Switch(config)# amp-server
  ip
Switch(config)# amp-server ip
  IP-ADDR Enter an IP address.
  IPv6-ADDR Enter an IPv6 address.
```
Switch(config)# amp-server ip 192.168.1.1
group AMP server group name.
Switch(config)# amp-server ip 192.168.1.1 group
GROUPNAME-STR AMP server group name.
Switch(config)# amp-server ip 192.168.1.1 group grpl1
folder AMP server folder name.
Switch(config)# amp-server ip 192.168.1.1 group grpl1 folder
FOLDERNAME-STR AMP server folder name.

flexible-module A type JL081A
snmp-server community "public" unrestricted
ocbm
    ip address dhcp-bootp
    exit
vlan 1
debug ztp

Syntax
d debug ztp
no debug ztp

Description
Enables or disables ZTP debug logging.

Parameters and options
ztp

Zero Touch Provisioning.

no

The no debug ztp command disables ZTP debug logging.

Stacking support
The ZTP process for stacked switches with AirWave is similar to the one for the standalone switch, with the exception that only the commander in the stack checks in with AirWave.

Disabling ZTP
ZTP is disabled if you make any of the following changes to the switch configuration:

• Enter the switch configuration mode using the configure terminal command.
• Enter into Menu and exit without doing any configuration
• Use CLI, SNMP, REST APIs, menu interface, or the web GUI to configure any settings. The change is shown in the running-configuration of the switch.
• To upgrade with nonminimal configuration set from any 15.xx version to version 16.01, see Image Upgrade.
• Once DHCP server or Activate offers Airwave/Central details, ZTP is disabled. If the details are offered again, it is ignored.

Image Upgrade
If you upgrade from any 15.xx version to version 16.xx, the following minimal set of configuration is validated to enable or disable the ZTP process:
• If the switch has any other VLAN apart from the default VLAN, ZTP gets disabled.
• In default VLAN, if the IPv4 address is not set as DHCP (default option is DHCP), ZTP gets disabled.
• In default VLAN, if IPv6 is enabled or configured, ZTP gets disabled.

If you have any other configuration during the upgrade, ZTP will continue to be in the enabled state.

**Troubleshooting**

**Cause**

You can troubleshoot switches by using the SSH connection and the device logs available in AirWave. For a list of all RMON message, refer to *ArubaOS-Switch Event Log Message Reference Guide*.

You can enable the debug logging with the `debug ztp` command, see `debug ztp`.

**AMP server messages**

To display the AMP server debug messages, enter:

```
switch# debug ztp
```

To print the debug messages to the terminal, enter:

```
switch# debug destination session
```

**Activate based ZTP with AirWave**

ZTP with Activate is used in the following scenarios to help switches check in through the Internet with public facing instances of Airwave:

• Deployments where administrators do not have a DHCP server to configure Airwave options
• Absence of corporate network reaching every branch

**Configuring Activate-based ZTP with AirWave**

For Activate-based ZTP, the switch connects to Aruba Activate service through the Internet and autoconfiguration takes place based on the settings provided in Activate. For more information on how to set up an Activate account, folder and their rules, refer to the *Aruba Activate User Guide*. 
In the preceding illustration, the workflow is as follows:

1. The switches being provisioned in the branches are booted and connect to the Activate on the cloud.
2. Based on the administrator’s provisioning (folder, rule), the device is placed in the appropriate folder before getting redirected to the AirWave server in the Corporate HQ.
3. The switches connect to the AirWave server, and the server pushes the configuration to the switches based on the AirWave folder, switch model, and branch location.
4. Optionally, an IPsec tunnel to the Controller in the HQ can be constructed to secure the management traffic to AirWave. This configuration can be set as part of the initial configuration push from Activate.

**IPsec for AirWave Connectivity**

**Overview**

This feature supports secure communication between the switch and Aruba mobility controller (VPN concentrator) for AirWave traffic. The switch also provides the necessary support for ZTP by establishing a secure tunnel between the switch and AirWave, which are provided by a DHCP server or Activate.

IPsec ensures that communication between the switch and AirWave server (management traffic) is protected by establishing a secure channel between the switches and the Aruba VPN Controller (connected to AirWave server).

**IPsec for Management Traffic**

IPsec supports ZTP in deployment scenarios less restrictive than private LANs. ZTP enables switches to be configured and managed automatically without administrator intervention. In a deployment scenario where a switch and AirWave are located in different branches connected through an untrusted public network (the Internet), the communication between the switch and AirWave server can be protected.

---

**NOTE:** IPsec tunnel is not supported with IPv6.

You can configure IPsec tunnel using any of the following methods:

- Activate ZTP
- DHCP ZTP with option 138
  1. To assign controller IP addresses, select DHCP option 138.
2. Define the controller IP addresses for both the primary and secondary controllers.

- Manual configuration

**IPsec Tunnel Establishment**

- IPsec tunnel for AirWave is auto-configured. The switch decides to create IPsec tunnel only when an Aruba controller IP is present in the device before establishing the connection to AirWave.
- If the controller IP is not provided, the switch will try to establish a direct connection to AirWave.
- If the controller IP is present, the switch auto configures and initiates an IPsec tunnel interface. Once the tunnel is established, the Aruba controller provides an inner IP which the switch will then use as source IP to send any AirWave bound traffic. The switch then creates a static route to AirWave with the IPsec tunnel interface as the gateway.

**IPsec Tunnel Failures**

The following behaviors can cause an IPsec tunnel creation failure:

- Time
The time in the switch has to be valid and correct. Time issues have been observed on this switch. Ensure that NTP configuration is set up on switch and on the controller where the tunnel is terminating.

- **Authentication**
  The switch MAC addresses for both members must be added to the Aruba controller whitelist.

- **Controller IP**
  The controller IP must be reachable from the switch.

- **Inner IP pool**
  Ensure the inner IP pool is configured on the controller. Tunnel establishment is not successful, if the pool is full.

- **Static Route**
  There must not be any conflicting static route in the system for the AirWave IP configured.

- **License**
  The controller must have sufficient license to support IPsec tunnels.

**IPsec tunnel to secondary controller**

ArubaOS-Switch assists support for IPsec tunnel between switch and the Aruba Controller (VPN concentrator) to carry the switch generated traffic to multiple services behind the Aruba Controller. The services include AirWave management station, ClearPass Policy Manager (CPPM), DNS, Syslog, and so on.

IPsec tunnel needs a backup support for IPsec session failure. If the existing IPsec session is lost, the switch is able to establish a new IPsec tunnel session with a backup controller (secondary controller).

**Backup controller support for IPsec tunnel**

ArubaOS-Switch supports two controllers with all the services such as CPPM, Syslog, DNS, and AirWave. In such scenarios, a controller is expected to function as a backup controller.

1. `aruba-vpn` is modified to support backup controller IP.

   ```
   aruba-vpn type amp peer-ip <IP_addr> backup-peer-ip <IP_addr>
   ```

   ```
   no aruba-vpn type amp peer-ip <IP_addr> backup-peer-ip <IP_addr>
   ```

   ```
   switch(config)# aruba-vpn type amp peer-ip 171.0.0.1 backup-peer-ip 171.0.0.3
   ```

2. When the switch is configured with both the primary and backup controllers, the switch will establish IPsec tunnel connection with primary controller.

3. Switch initiates a new IPsec session with either primary or backup controller once "Dead Peer Detection" event is triggered for existing IPsec session.

4. Switch retries establishing IPsec session with both primary and backup controllers alternatively until a successful IPsec handshake.

5. Switch tries to establish the IPsec tunnel with the same controller when the following events occur:
• Switch IP change
• Vlan ID change
• Redundancy switch over

6. If \texttt{aruba-vpn type} is \textit{amp}, after five consecutive AirWave check-in failures, the existing tunnel destroyed and an IPSec tunnel are established with the other controller.

\textbf{NOTE:} ZTP continues to support existing DHCP options for AirWave or Controller IP discovery. You can configure both the primary and backup controllers IP in DHCP.

Switch reachability to the controllers

\textbf{Figure 33: Controllers through same VLAN}

\textbf{Figure 34: Controllers through different VLANs}
Restrictions

1. Priority based failover is not supported. It is assumed that both the primary and backup controllers are of the same priority.

2. When there is a failover to backup controller, the primary controller will not try to re-establish the IPsec session even it becomes active.

3. Failover to the other (either primary or secondary) controller results in data loss. All the existing application sessions in the switch are expected to be terminated.

   NOTE: The failover will take up to three minutes.

4. The events such as time change and port flap, breaks the existing IPsec session and triggers a failover. The new IPsec session is established with a backup controller. In such scenario, switch does not perform any reachability test before selecting a controller to retry.

AirWave IP after discovery

AirWave IP and Aruba Controller IP (either from the Activate Server or from a DHCP server) are established and auto configured in an IPsec-IPv4 Tunnel. Once received, the IPsec tunnel is auto configured and established to send AirWave traffic securely. The Aruba Controller provides an inner-ip to the switch which then can communicate with AirWave.

Configuring the Aruba controller

On the Aruba Controller, configure through CLI:

Procedure

1. Add the switch MAC address to whitelist for authentication. For more information, refer [http://www.arubanetworks.com/techdocs/ArubaOS_63_Web_Help/Content/ArubaFrameStyles/Control_Plane/Whitelists_on_Campus_and_Remote_APsWith.htm](http://www.arubanetworks.com/techdocs/ArubaOS_63_Web_Help/Content/ArubaFrameStyles/Control_Plane/Whitelists_on_Campus_and_Remote_APsWith.htm)

2. Add an IP address pool that can be assigned to switch after tunnel creation. The IP range must not overlap with the interfaces IP on the controller.

   ip local pool "ipsec" 2.0.0.100 2.0.0.255

3. Create access lists that permit AirWave traffic and assign them to ap-roles. It is required only if the controller version is less than 6.5.2.0 or 8.1.0.0. If required, you can add specific acls such as `sys-switch-role`.

   ip access-list session acl
   any any tcp 22 permit
   any any tcp 443 permit
   user-role sys-switch role
   access-list session acl

4. View the whitelist.

AirWave Controller IP configuration commands
**aruba-vpn type**

**Syntax**

aruba-vpn type amp peer-ip <IP_addr> backup-peer-ip <IP_addr>

no aruba-vpn type amp peer-ip <IP_addr> backup-peer-ip <IP_addr>

aruba-vpn type any peer-ip <IP_addr> backup-peer-ip <IP_addr>

no aruba-vpn type any peer-ip <IP_addr> backup-peer-ip <IP_addr>

**Description**

Configure the Aruba VPN type, peer IP address. When Aruba VPN type is any, the tunnel is established interdependent of Airwave configuration.

The no form of the command removes the aruba-vpn type statement from the configuration.

**Parameters**

*type*

Configure the controller IP.

*amp*

Configure Remote Access VPN session to protect specific switch generated traffic. It also supports secure ZTP of Airwave Management Platform (AMP) server.

*any*

Configure Remote Access VPN session to protect specific switch generated traffic. Secure ZTP is not supported.

*<IP_addr>*

IP address of the VPN.

**Usage**

switch(config)# aruba-vpn type

switch(config)# aruba-vpn type amp

switch(config)# aruba-vpn type amp peer-ip

switch(config)# aruba-vpn type any

**NOTE:**

- When you configure aruba-vpn type as any, the switch creates a tunnel and updates the inner-ip.
- You can create routes using the `ip route` command for next hop as aruba-vpn sends management traffic over the tunnel. For example: `ip route 2.0.0.0 255.255.255.0 tunnel aruba-vpn`

**Show commands**
**show aruba-vpn**

**Syntax**

```
show aruba-vpn type <VPN-TYPE>
```

**Description**

Show Aruba-VPN configuration information.

---

**show aruba-vpn**

```
show aruba-vpn
```

- **Aruba VPN details**
  - **Aruba VPN Type**: amp
  - **Aruba VPN Peer IP**: 171.0.0.1
  - **Aruba VPN Backup Peer IP**: 171.0.0.3
  - **Aruba VPN Config Status**: Configured
  - **Aruba VPN tos**: Value from IPv4 header
  - **Aruba VPN ttl**: 64

Chapter 10 Zero Touch Provisioning with AirWave and Central
show interfaces tunnel aruba-vpn

Syntax

show interfaces tunnel aruba-vpn

Description

Auto-configured tunnel interface before creating IPsec. The tunnel ID is auto generated and to avoid conflict with user generated tunnel interface, the tunnel id is always the max tunnel supported by the switch + 1.

aruba-vpn

Display the configuration and status details of aruba-vpn tunnel.

brief

Display brief configuration and status for all tunnels.

Usage

show interfaces tunnel aruba-vpn
show interfaces tunnel brief
show interfaces [tunnel] [<TUNNEL-LIST> | <TUNNEL-NAME> | brief | type]

switch(config)# show interfaces tunnel aruba-vpn

Tunnel Configuration :

Tunnel : tunnel-129
Tunnel Name : aruba-vpn-tunnel
Tunnel Status : Enabled
Source Address : 192.168.20.10
Destination Address : 171.0.0.3
Mode : IPsec IPv4
TOS : Value from IPv4 header
TTL : 64
IPv6 : Disabled
MTU : 1280

Current Tunnel Status :

Tunnel State : Up
Destination Address Route : 0.0.0.0/0
Next Hop IP : 192.168.20.31
Next Hop Interface : vlan-1
Next Hop IP Link Status : Up
Source Address : Configured on vlan-1
IP Datagrams Received : 11
IP Datagrams Transmitted : 36
switch(config)# show interfaces tunnel brief
Status - Tunnel Information Brief
Tunnel                   : tunnel-129
Mode                     : IPsec IPv4
Source Address           : 192.168.20.10
Destination Address      : 171.0.0.3
Configured Tunnel Status : Enabled
Current Tunnel State     : Up

show crypto-ipsec sa
Syntax
show crypto ipsec sa
Description
Show crypto-IPsec statistics.

switch# show crypto ipsec sa

Crypto IPSec Status

ZTP with Aruba Central

Aruba Central does not require any configuration of local DHCP server or other network components but requires a switch with Internet access.

Users with access to Central cloud portal must provision their switches and assign licenses accordingly. Once complete, Central will automatically program the Activate portal with the required switch details and the group to which the switch must check in.

The following diagram illustrates the working of Central ZTP:

The workflow is as follows:
1. The switches being provisioned in branches boot and connect to the Activate on the cloud.

2. Based on administrator’s provisioning (such as folder, rule), the device is placed in the appropriate folder before being redirected to the Aruba Central.

3. The switches check-in with Central and the server pushes the configuration to the switches based on the group, switch model, and branch location.

For more information on Central configuration, refer to the *Aruba Central Configuration Guide*.

After the switch successfully checks-in with Central, the following management interfaces on the switch are disabled:

- WebUI
- REST
- SNMP
- TR-69
- Menu

There is a restriction on executing the following commands over CLI:

- boot
- recopy
- erase
- reload
- startup-default
- upgrade-software
- setup
- delete
- reboot
- restore
- menu
- write memory
- amp-server

**LED Blink feature**

Central connectivity loss is indicated by LEDs. If connectivity is broken and Aruba-Central is enabled, the USR/FDX and Locator LEDs will blink. The LEDs will stop blinking once the switch is connected back to Central.

**Aruba Central Configuration manually**

In factory default switches, ZTP with Central is turned ON. ZTP can be disabled in the following scenarios:
Switches with edited configuration

Switches where the administrator has explicitly turned off ZTP with Central

In any of the mentioned scenarios, an administrator can manually configure Aruba Central using the `aruba-central` command.

**aruba-central**

**Syntax**

```plaintext
aruba-central {enable | disable | support-mode {enable | disable}}
```

**Description**

Configure Aruba Central server support. When enabled, and when a server web address has been obtained using Aruba Activate, the system will connect to an Aruba Central server. The system will obtain configuration updates and most local configuration commands will be disabled. This mode is enabled by default.

Enter support mode to enable all configuration commands. Normally, when the system is connected to an Aruba Central server, the configuration is updated from that server and most local configuration commands are disabled. Support mode enables those commands for use in troubleshooting problems. Support mode is disabled by default. When the system is not connected to Aruba Central server, the full command set is enabled for local configuration.

**Restrictions**

- Switch communication to Aruba Central is not supported via OOBM.
- `aruba-central` is not supported in FIPS switches and it will be disabled by default.
- `aruba-central` is not supported in Stack switches and it will be disabled by default.

**CAUTION:** To avoid broadcast storm or loops in your network while configuring ZTP, do not have redundant links after you complete ZTP and Airwave registration. Authorize the new switch and then push the Golden Configuration template from Airwave.

**Example**

Enable Aruba Central server support

```
switch(config)# aruba-central enable
```

Disable Aruba Central server support

```
switch(config)# aruba-central disable
```

Enter support mode to enable all CLI configuration commands

```
switch(config)# aruba-central support-mode enable
```

This mode will enable all CLI configuration commands, including those normally reserved by the Aruba Central service. Use of this mode may invalidate the configuration provisioned through Aruba Central server. Continue (y/n)?

**aruba-central support-mode**

**Syntax**

```plaintext
aruba-central support-mode
```
Description
Enter support mode to enable all configuration commands. Normally, when the system is connected to an Aruba Central server, the configuration is updated from that server and most local configuration commands are disabled. Support mode enables those commands for use in troubleshooting problems. Support mode is disabled by default. When the system is not connected to Aruba Central server, the full command set is enabled for local configuration.

Usage
aruba-central support-mode {enable | disable}

Example
switch(config)# aruba-central support-mode enable
This mode will enable all CLI configuration commands, including those normally reserved by the Aruba Central service. Use of this mode may invalidate the configuration provisioned through Aruba Central server. Continue (y/n)?

Activating ArubaOS-Switch Firmware Integration
CLIs are available for Activate firmware updates which enables, update, checks and shows firmware upgrades.

Operating Notes
Switch will periodically check with Activate every seven days for the latest image version.

Download the image from the URL provided by Activate and upgrade the switch with the new image.

Restrictions
When a switch is managed by either AirWave or Central, the automatic firmware check is disabled. The manual firmware check is available.

Activate upgrade from the non-supported build is disabled upon upgrading to version 16.03.

Upon upgrade from version 16.02 to version 16.03 with activate provision enabled, activate software update will be enabled.

activate software-update enable

Syntax
activate software-update [enable | disable]

Description
Enables or disables the Activate software update.

Activate software-update is enabled by default.

Options
disable
Disables the Activate software update.
enable

Enables the Activate software update.

Example
Switch will check with activate for every seven days for latest image available and RMON logs will be generated:

```
I 10/25/16 14:04:27 05219 activate:
A system software update is available to version WB.16.02.0012.
```

`activate software-update check`

Syntax
`activate software-update check`

Description
Check the Activate software update manually.

Example
```
switch(config)$# activate software-update check

Configuration and Status - Activate Software Update

Activate Server Address : device.arubanetworks.com
Activate Server Polling : Enabled
Installed Software Version : WB.16.04.0000x
Server Software Version : Not available - server communication error.
Server Software Image URL : Not available - server communication error.

switch(config)$
```

**NOTE:** This switch is not connected to Activate, hence communication error is shown in “Server Software Version” and “Server Software Image URL” field.

`activate software-update update`

Syntax
`switch#(config) activate software-update update`

Description
Updates the software for Activate.

Options
- `primary`
  Update primary software image using the Aruba Activate server.
- `secondary`
  Update secondary software image using the Aruba Activate server.

Example
```
switch# activate software-update update

This command will save the current configuration, update the selected software image, and reboot the system to the selected partition.
```
show activate software-update

Syntax
show activate software-update

Description
Show the configuration and status of the Activate software update.

Example output

switch(config)$ show activate software-update
Configuration and Status - Activate Software Update
   Activate Server Address     : device.arubanetworks.com
   Activate Server Polling    : Enabled
   Installed Software Version : WB.16.04.0000x
   Server Software Version   : Not available - server communication error.
   Server Software Image URL : Not available - server communication error.
switch(config)$

Show activate provision

Syntax
show activate provision

Description
Show the configuration and status of the Activate Provision services.

Examples

switch(config)# show activate provision
Configuration and Status - Activate Provision service
   Activate server address     : device.arubanetworks.com
   Activate server polling    : Enabled
   Activation key             : ABC-XYZ-123

Default status when Activate server polling is not started

switch(config)# show activate provision
Configuration and Status - Activate Provision Service
   Activate Provision Service : Enabled
   Activate Server Address   : device.arubanetworks.com
   Activation Key            : Not Available
   NTP/HTP Time Sync Status  : Not Updated
   Activate DNS Lookup       : NA
   Proxy Server DNS Lookup   : NA
   Activate Connection Status: NA
   Error Reason              : NA

Connected to Activate (post DNS resolution) and got Central URL
**switch(config)#show activate provision**

<table>

                            | • Failure  
                            | • NA  | Default - NA |

**Troubleshooting**

You can troubleshoot switches by using the SSH connection and the device logs available in AirWave. For a list of all RMON message, refer to Event Log Messages Guide of your switch.

You can enable the debug logging with the debug ztp command, see debug ztp.

**Show aruba-central**

**Syntax**

```
show aruba-central
```

**Description**

Shows Aruba Central server information.

**Example**

**debug ztp**

**Syntax**

ddebug ztp

no debug ztp

**Description**

Enables or disables ZTP debug logging.

**Parameters and options**

ztp

Zero Touch Provisioning.

no

The *no debug ztp* command disables ZTP debug logging.

**Error Reason log for Activate Provision**

Error Reason field is added in the switch firmware as part of Aruba Central Onboarding Feature from 16.07. Error reason log helps in debugging switch firmware for central connectivity failure.

Following table shows the list of error reasons.
### Stacking support

The ZTP process for stacked switches with Central is similar to the one for a standalone switch, with the exception that only the commander in the stack checks in with Central. For switches supported on Central when stacking is ON, refer to the *Aruba Central Switch Configuration Guide*.

### Fault finder switch events

<table>

</tr>
</tbody>
</table>

**interface device-type network-device**

**Syntax**

```
interface <PORT-LIST> device-type network-device
no interface <PORT-LIST> device-type network-device
```

**Description**

Configures the type of device and identifies a port connected with a network infrastructure device (such as switch, AP, router). The switch will not report the client entries on the port to Central.

The `no` form of this command removes the configuration of type of the device connected to the ports.

**Command context**

```
config
```
Parameters

PORT-LIST

Specifies the port number for the device.

Usage

[no] device-type { network-device }

Example

Switch(config)# interface 2
device-type       Configures the type of device being connected to the port.
switch(config)# interface 2 device-type
network-device    Marks a port being connected with a network infra
device (switch / AP / router).
switch(config)# interface 2 device-type network-device

Switch(config)# show running config
; JL074A Configuration Editor; Created on release #KB.16.04.0000x

interface 2
  device-type network-device
  exit
interface 3
  device-type network-device
  exit

HTTP Proxy support with ZTP overview

The Aruba switch connects through Public Cloud or infrastructure to access Aruba Activate and Aruba Central. The switch can use a combination of the Public and Private networks to access Aruba AirWave, and Aruba ClearPass Policy Manager (CPPM). In this case, the switch is visible as an Internet asset that can cause data breaching. Routing connections through the enterprise proxy servers prevents the data breaching.

The ArubaOS-Switch does not set up an HTTP/SSL connection with the public or private server directly. Instead, the switch sets up a TCP connection with the proxy server.

If the public server is available and reachable through the proxy server, then the switch connection to the destination server is successful. After establishing the connection, the proxy server behaves as a Network Address Translation (NAT) device, in which case, the proxy server forwards the received packets to the intended destinations.

Limitations:

- HTTPS proxy is not supported.
- Authenticating the HTTP proxy is not supported.
- HTTP proxy support is only for IPv4 endpoints.

Configuring ZTP:
When the switch is provisioned for Central or Controller, switch is managed once it is connected to the public network. In case the user wants to reach the public network through the proxy, then the IP address of the proxy server must be present in the switch before initiating the Activate or Central connectivity.

In ZTP mode, the proxy IP address can be received using the DHCP option. The ZTP mode works when the switch is booted with a default configuration. For the switch to connect to public servers through proxy, the proxy IP must be known through DHCP. The switch requests an IP address from the primary VLAN.

The proxy IP address is received through a vendor-specific DHCP option. The switch parses and uses the proxy IP address to connect in ZTP mode. Aruba switches reserve suboption -148 under DHCP vendor-specific option 43 for configuring proxy URL.

After the switch is out of ZTP mode, the proxy IP address if configured through CLI takes precedence. Otherwise, the Aruba OS switch may use the DHCP received proxy IP address for connectivity.

**Proxy Configuration**

When configuring the proxy server, the following applications will be taking the proxy route to reach the destination. You can configure the proxy server as indicated in DHCP or proxy server command.

- Aruba AirWave
- Aruba Activate
- Firmware download through MNP
- Aruba CPPM connectivity
- Aruba Central connectivity
- TR69 support

**Support for Aruba AirWave**

AirWave is used to manage the ArubaOS-Switches and its communication to the switch is over HTTPS. When AirWave is deployed with Aruba controller, an IPsec tunnel is created between the switch and the controller. All the communication between the switch and AirWave occurs through the tunnel. In this case, the proxy is bypassed implicitly.

AirWave establishes ICMP, SNMP, and SSH connections to the switch for switch management. Since AirWave does not have the visibility for the switch IP address, the ICMP, SNMP, and SSH connections will not be initiated to the switch. So reverse NAT functionality must be enabled for ensuring these packets reach the switch. If AirWave must work without proxy, then AirWave IP is bypassed explicitly.

**Support for Aruba ClearPass**

For downloading a user role from CPPM, switch initiates HTTPS connection with ClearPass. If the proxy is configured, proxy server is used to reach CPPM. When CPPM is deployed with Aruba controller, CPPM must be explicitly exempted from proxy. Add the CPPM IP address in the exception list of the proxy as the communication happens through the IPsec tunnel or normally.

**Proxy Configuration using windows DHCP server**

In the ZTP provisioning, you can push the Proxy server and exception configurations through a Windows DHCP server using DHCP option 148.

**Procedure**

1. Add a new **DHCP Server** role. Navigate to **Server Manager > Roles > DHCP sever > domain DHCP Server > IPv4**. In the master pane of the Server Manager window, click **IPv4** and select **Define Vendor classes**.
2. To get vendor-specific value of a switch, go to switch command prompt and enter `show dhcp client vendor-specific` command. Vendor class identifier for the switch (VCI) appears as follows:

```
Switch# show dhcp client vendor-specific
Vendor Class Id = J9854A 2530-24G-PoE+-2SFP+ Switch
```
Processing of Vendor Specific Configuration is enabled.

3. Add **Displayed name** and **Description** for the **New Vendor Class** in the ASCII field, add `J9854A 2530-24G-PoE+-2SFP+ Switch` value exactly obtained from the switch, otherwise the option may not work.
4. Right-click IPv4 and select Set Predefined Options. Select option class as the newly defined vendor class, click ADD and enter the following information for Proxy details:

   a. Name - Proxy
   b. Data Type - String
   c. Code - 148
   d. Description - Proxy details.
Now the new vendor class will have new suboption with code 148. Next is to add these vendor class and suboptions to the scope. To add proxy server details to scope, navigate to Server Manager and select Server Options in the IPv4 window.

5. Right click server options and select Configure options. Go to Advanced tab, select the vendor class from the menu as the newly defined class. New suboptions that are added appears.

Check 148 and add Proxy details in string value field, in the format as mentioned:

<http://web-proxy.in.ABCcorp.net:8080> or <http://192.168.50.18:3128>

Check 144 and add configuration filename in string value field (optional).
6. Click **Apply** and **OK** and the proxy option is added in the Server options.

7. Now restart the DHCP service and download new DHCP attributes in the switch, you can check that the proxy details are correctly downloaded in the switch using the `show proxy config` command.
### proxy server

**Syntax**

```
proxy server <http://<ip-addr/FQDN>:port number>
```

```
no proxy server
```

**Description**

Configures the URL/IP address to reach the proxy server. Provide the correct proxy port number along with the URL/IP address. Port number must be in the range of 1024 to 65535. HTTPS proxy server is not supported.

The `no` form of this command removes the proxy server.

**Command context**

```
config
```

**Parameters**

- **url:port number**
  
  Specifies the URL address with port number for the proxy server.

- **ip-addr:port number**
  
  Specifies the IP address with port number for the proxy server.

**Example**

```
switch(config)# proxy server "http://web-proxy.au.abccorp.net:3128"
switch(config)# proxy server "http://192.168.0.6:8080"
```

### proxy exception ip | host

**Syntax**

```
proxy exception ip | host {ip-addr/mask-length | hostname}
```

```
no proxy exception ip | host {ip-addr/mask-length | hostname}
```

**Description**

Configures an IPv4 address/mask length and URL to the list of IP address and host, which can be reached without the HTTP proxy server.

The `no` form of this command removes the proxy exception for the specified entry (IPv4 address/host name).

**Command context**

```
config
```

**Parameters**

- **ip-addr/mask-length | hostname**
  
  Specifies IPv4 address/mask length and host name.
Example

switch(config)# proxy exception ip 192.168.0.10/12
switch(config)# proxy exception host "http://web-proxy.au.abdcorp.net:3128"

**show proxy config**

**Syntax**

```
show proxy config
```

**Description**

Shows the proxy configuration.

**Command context**

```
config
```

**Examples**

```
switch(config)# show proxy config

Http Proxy Configuration details

    Server URL : http://web-proxy.au.abdcorp.net:3128

Manually configured exceptions

    No    Exception
    ------ -----------------------------------------
    1    192.168.0.10/12
    2    http://web-proxy.au.abdcorp.net:3128

Automatically added exceptions

    No    Exception
    ------ -----------------------------------------
    1    2.0.0.9

```

**NOTE:** On configuring IPsec tunnel, Airwave IP is automatically added as an exception in the switch. The IPsec tunnel is configured directly over the network bypassing the HTTP proxy server.
Overview

The switches support several methods for transferring files to and from a physically connected device or via the network, including TFTP and Xmodem. This appendix explains how to download new switch software, upload or download switch configuration files and software images, and upload command files for configuring ACLs.

Downloading switch software

Switch periodically provides switch software updates through the Switch Networking website. For more information, see the support and warranty booklet shipped with the switch, or visit http://www.hpe.com/networking and click on software updates.

NOTE: This manual uses the terms switch software and software image to refer to the downloadable software files the switch uses to operate its networking features. Other terms sometimes include Operating System, or OS.

General software download rules

- Switch software that you download via the menu interface always goes to primary flash.
- After a software download, you must reboot the switch to implement the new software. Until a reboot occurs, the switch continues to run on the software it was using before the download.

NOTE:

Downloading new switch software does not change the current switch configuration. The switch configuration is contained in separate files that can also be transferred. See Transferring switch configurations on page 344.

In most cases, if a power failure or other cause interrupts a flash image download, the switch reboots with the image previously stored in primary flash. In the unlikely event that the primary image is corrupted (which may occur if a download is interrupted by a power failure), the switch goes into boot ROM mode. In this case, use the boot ROM console to download a new image to primary flash.

Using TFTP to download software from a server

This procedure assumes that:

- A software version for the switch has been stored on a TFTP server accessible to the switch. (The software file is typically available from the Switch Networking website at http://www.hpe.com/networking.)
- The switch is properly connected to your network and has already been configured with a compatible IP address and subnet mask.
- The TFTP server is accessible to the switch via IP.

Before you use the procedure, do the following:
• Obtain the IP address of the TFTP server in which the software file has been stored.
• If VLANs are configured on the switch, determine the name of the VLAN in which the TFTP server is operating.
• Determine the name of the software file stored in the TFTP server for the switch (For example, E0820.swi).

NOTE: If your TFTP server is a UNIX workstation, ensure that the case (upper or lower) that you specify for the filename is the same case as the characters in the software filenames on the server.

Troubleshooting TFTP download failures

Cause

When using the menu interface, if a TFTP download fails, the Download OS (Operating System, or software) screen indicates the failure as seen in the following figure.

Figure 35: Example: of message for download failure

Some of the causes of download failures include:

• Incorrect or unreachable address specified for the TFTP Server parameter. This may include network problems.
• Incorrect VLAN.
• Incorrect name specified for the Remote File Name parameter, or the specified file cannot be found on the TFTP server. This can also occur if the TFTP server is a UNIX machine and the case (upper or lower) for the filename on the server does not match the case for the filename entered for the Remote File Name parameter in the Download OS (Operating System, or software) screen.
• One or more of the switch's IP configuration parameters are incorrect.
• For a UNIX TFTP server, the file permissions for the software file do not allow the file to be copied.
• Another console session (through either a direct connection to a terminal device or through Telnet) was already running when you started the session in which the download was attempted.

To find more information on the cause of a download failure:
• Examine the messages in the switch’s Event Log by executing the `show log tftp` command from the CLI.

• For descriptions of individual Event Log messages, see the latest version of the event log message reference guide for your switch, available on the Switch website. (See “Getting Documentation From the Web”.)

NOTE: If an error occurs in which normal switch operation cannot be restored, the switch automatically reboots itself, and an appropriate message is displayed after the reboot.

**Downloading from a server to flash using TFTP (CLI)**

**Syntax:**

```
copy tftp flash <ip-address> <remote-file> [<primary | secondary>]
```

Automatically downloads a switch software file to primary or secondary flash. If you do not specify the flash destination, the TFTP download defaults to primary flash.

**Example:**

To download a switch software file named k0800.swi from a TFTP server with the IP address of 10.28.227.103 to primary flash:

**Procedure**

1. Execute `copy` as shown below:

   The command to download an OS (switch software)

   ```
   switch# copy tftp flash 10.28.227.103 k0800.swi
   The primary OS Image will be deleted, continue [y/n]? y
   01431K
   ```

   • ¹This message means that the image you want to upload will replace the image currently in primary flash.

   • ²Dynamic counter continually displays the number of bytes transferred.

   When the switch finishes downloading the software file from the server, it displays this progress message:

   `Validating and Writing System Software to FLASH ...`

   2. When the download finishes, you must reboot the switch to implement the newly downloaded software image. To do so, use one of the following commands:

   **Syntax:**

   ```
   boot system flash {<primary | secondary>}
   ```

   Boots from the selected flash.

   **Syntax:**

   `reload`

   Boots from the flash image and startup-config file. A switch covered in this guide (with multiple configuration files), also uses the current startup-config file.
For more information on these commands, see "Rebooting the Switch" in the basic operation guide for your switch.

3. To confirm that the software downloaded correctly, execute `show system` and check the **Firmware revision** line.

For information on primary and secondary flash memory and the boot commands, see "Using Primary and Secondary Flash Image Options" in the basic operation guide for your switch.

**NOTE:** If you use `auto-tftp` to download a new image in a redundant management system, the active management module downloads the new image to both the active and standby modules. Rebooting after the `auto-tftp` process completes reboots the entire system.

**Enabling TFTP (CLI)**

TFTP is enabled by default on the switch. If TFTP operation has been disabled, you can re-enable it by specifying TFTP client or server functionality with the `tftp [client|server]` command at the global configuration level.

**Syntax:**

```
[no] tftp [client | server]
```

Disables/re-enables TFTP for client or server functionality so that the switch can:

- Use TFTP client functionality to access TFTP servers in the network to receive downloaded files.
- Use TFTP server functionality to upload files to other devices on the network.

**NOTE:** Usage notes

To disable all TFTP client or server operation on the switch except for the auto-TFTP feature, enter the `no tftp [client|server]` command.

When IP SSH file transfer is used to enable SCP and SFTP functionality on the switch, this disables TFTP client and server functionality. Once ip ssh file transfer is enabled, TFTP and auto-TFTP cannot be re-enabled from the CLI.

When TFTP is disabled, instances of TFTP in the CLI `copy` command and the Menu interface "Download OS" screen become unavailable.

The `no tftp [client|server]` command does not disable auto-TFTP operation. To disable an auto-TFTP command configured on the switch, use the `no auto-tftp` command to remove the command entry from the switch's configuration.

For information on how to configure TFTP file transfers on an IPv6 network, see the "IPv6 Management Features" in the IPv6 configuration guide for your switch.

**Configuring the switch to download software automatically from a TFTP server using auto-TFTP (CLI)**

The `auto-tftp` command lets you configure the switch to download software automatically from a TFTP server.

At switch startup, the auto-TFTP feature automatically downloads a specified software image to the switch from a specified TFTP server and then reboots the switch. To implement the process, you must first reboot the switch using one of the following methods:
• Enter the `boot system flash primary` command in the CLI.

• With the default flash boot image set to primary flash (the default), enter the `boot` or the `reload` command, or cycle the power to the switch. (To reset the boot image to primary flash, use `boot set-default flash primary`.)

**Syntax:**

```plaintext
auto-tftp <ip-addr> <filename>
```

By default, auto-TFTP is disabled. This command configures the switch to automatically download the specified software file from the TFTP server at the specified IP address. The file is downloaded into primary flash memory at switch startup; the switch then automatically reboots from primary flash.

---

**NOTE:** To enable auto-TFTP to copy a software image to primary flash memory, the version number of the downloaded software file (For example, XX_14_01.swi) must be different from the version number currently in the primary flash image.

The current TFTP client status (enabled or disabled) does not affect auto-TFTP operation. (See **Enabling TFTP (CLI)** on page 333.)

Completion of the auto-TFTP process may require several minutes while the switch executes the TFTP transfer to primary flash and then reboots again.

The `no` form of the command disables auto-TFTP operation by deleting the `auto-tftp` entry from the startup configuration.

The `no auto-tftp` command does not affect the current TFTP-enabled configuration on the switch. However, entering the `ip ssh filetransfer` command automatically disables both `auto-tftp` and `tftp` operation.

### Use USB to transfer files to and from the switch

The switch’s USB port (labeled as **Aux Port**) allows the use of a USB flash drive for copying configuration files to and from the switch.

Operating rules and restrictions:

• Unformatted USB flash drives must first be formatted on a PC (Windows FAT format.) For devices with multiple partitions, only the first partition is supported. Devices with secure partitions are not supported.

• If they already exist on the device, subdirectories are supported. When specifying a `filename`, you must enter either the individual file name (if at the root) or the full path name (for example, `/subdir/filename`).

• To view the contents of a USB flash drive, use the `dir` command. This lists all files and directories at the root. To view the contents of a directory, you must specify the subdirectory name (that is, `dir subdirectory`).

• The USB port supports a single USB device. USB hubs to add more ports are not supported.

---

**NOTE:** Some USB flash drives may not be supported on your switch. Consult the latest **Release Notes** for information on supported devices.

### Using SCP and SFTP

For some situations you may want to use a secure method to issue commands or copy files to the switch. By opening a secure, encrypted SSH session and enabling `ip ssh file transfer`, you can then use a third-party software application to take advantage of SCP and SFTP. SCP and SFTP provide a secure alternative to TFTP for transferring information that may be sensitive (like switch configuration files) to and from the switch. Essentially, you are creating a secure SSH tunnel as a way to transfer files with SFTP and SCP channels.
Once you have configured your switch to enable secure file transfers with SCP and SFTP, files can be copied to or from the switch in a secure (encrypted) environment and TFTP is no longer necessary.

To use these commands, you must install on the administrator workstation a third-party application software client that supports the SFTP and/or SCP functions. Some examples of software that supports SFTP and SCP are PuTTY, Open SSH, WinSCP, and SSH Secure Shell. Most of these are freeware and may be downloaded without cost or licensing from the internet. There are differences in the way these clients work, so be sure you also download the documentation.

As described earlier in this chapter you can use a TFTP client on the administrator workstation to update software images. This is a plain-text mechanism that connects to a standalone TFTP server or another switch acting as a TFTP server to obtain the software image files. Using SCP and SFTP allows you to maintain your switches with greater security. You can also roll out new software images with automated scripts that make it easier to upgrade multiple switches simultaneously and securely.

SFTP is unrelated to FTP, although there are some functional similarities. Once you set up an SFTP session through an SSH tunnel, some of the commands are the same as FTP commands. Certain commands are not allowed by the SFTP server on the switch, such as those that create files or folders. If you try to issue commands such as `create` or `remove` using SFTP, the switch server returns an error message.

You can use SFTP just as you would TFTP to transfer files to and from the switch, but with SFTP, your file transfers are encrypted and require authentication, so they are more secure than they would be using TFTP. SFTP works only with SSH version 2 (SSH v2).

**NOTE:** SFTP over SSH version 1 (SSH v1) is not supported. A request from either the client or the switch (or both) using SSH v1 generates an error message. The actual text of the error message differs, depending on the client software in use. Some examples are:

```
Protocol major versions differ: 2 vs. 1
Connection closed
Protocol major versions differ: 1 vs. 2
Connection closed
Received disconnect from <ip-addr> : /usr/local/libexec/
sftp-server: command not supported
Connection closed
```

SCP is an implementation of the BSD `rcp` (Berkeley UNIX remote copy) command tunneled through an SSH connection.

SCP is used to copy files to and from the switch when security is required. SCP works with both SSH v1 and SSH v2. Be aware that the most third-party software application clients that support SCP use SSHv1.

The general process for using SCP and SFTP involves three steps:

**Procedure**

1. Open an SSH tunnel between your computer and the switch if you have not already done so.
   
   (This step assumes that you have already set up SSH on the switch.)

2. Execute `ip ssh filetransfer` to enable secure file transfer.

3. Use a third-party client application for SCP and SFTP commands.

**Enabling SCP and SFTP**

For more information about secure copy and SFTP, see [Using SCP and SFTP](#) on page 334.
Procedure

1. Open an SSH session as you normally would to establish a secure encrypted tunnel between your computer and the switch.

   For more detailed directions on how to open an SSH session, see "Configuring secure shell (SSH)" in the access security guide for your switch. Please note that this is a one-time procedure for new switches or connections. If you have already done it once you should not need to do it a second time.

2. To enable secure file transfer on the switch (once you have an SSH session established between the switch and your computer), open a terminal window and enter the following command:

   ```
   switch(config)# ip ssh filetransfer
   ```

   For information on disabling TFTP and auto-TFTP, see Disabling TFTP and auto-TFTP for enhanced security on page 336.

Disabling TFTP and auto-TFTP for enhanced security

Using the `ip ssh filetransfer` command to enable SFTP automatically disables TFTP and auto-TFTP (if either or both are enabled), as shown below.

### Switch configuration with SFTP enabled

```
switch(config)# ip ssh filetransfer
Tftp and auto-tftp have been disabled. 1
switch(config)# sho run

Running configuration:

; J9091A Configuration Editor; Created on release #xx.15.xx

hostname "Switch"
module 1 type J8702A
module 2 type J702A
vlan 1
   name "DEFAULT_VLAN"
      untagged A1-A24,B1-B24
      ip address 10.28.234.176 255.255.240.0
      exit
ip ssh filetransfer 2
no tftp-enable
password manager
password operator
```

1 Enabling SFTP automatically disables TFTP and auto-tftp and displays this message.

2 Viewing the configuration shows that SFTP is enabled and TFTP is disabled.

If you enable SFTP and then later disable it, TFTP and auto-TFTP remain disabled unless they are explicitly re-enabled.

Operating rules are:

- The TFTP feature is enabled by default, and can be enabled or disabled through the CLI or an SNMP application. Auto-TFTP is disabled by default and must be configured through the CLI.

- While SFTP is enabled, TFTP and auto-TFTP cannot be enabled from the CLI. Attempting to enable either non-secure TFTP option while SFTP is enabled produces one of the following messages in the CLI:
SFTP must be disabled before enabling TFTP.

SFTP must be disabled before enabling auto-TFTP.

Similarly, while SFTP is enabled, TFTP cannot be enabled using an SNMP management application. Attempting to do so generates an "inconsistent value" message. (An SNMP management application cannot be used to enable or disable auto-TFTP.)

- To enable SFTP by using an SNMP management application, you must first disable TFTP and, if configured, auto-TFTP on the switch. You can use either an SNMP application or the CLI to disable TFTP, but you must use the CLI to disable auto-TFTP.

**Enabling SSH V2 (required for SFTP)**

```
switch(config)# ip ssh version 2
```

**NOTE:** As a matter of policy, administrators should **not** enable the SSH V1-only or the SSH V1-or-V2 advertisement modes. SSHv1 is supported on only some legacy switches.

**Confirming that SSH is enabled**

```
switch(config)# show ip ssh
```

Once you have confirmed that you have enabled an SSH session (with the `show ip ssh` command), enter `ip ssh filetransfer` so that SCP and/or SFTP can run. You can then open your third-party software client application to begin using the SCP or SFTP commands to safely transfer files or issue commands to the switch.

**NOTE:**

Any attempts to use SCP or SFTP without using `ip ssh filetransfer` cause the SCP or SFTP session to fail. Depending on the client software in use, you will receive an error message on the originating console, for Example:

```
IP file transfer not enabled on the switch
```

**Disabling secure file transfer**

```
switch(config)# no ip ssh filetransfer
```

**Authentication**

Switch memory allows up to ten public keys. This means the authentication and encryption keys you use for your third-party client SCP/SFTP software can differ from the keys you use for the SSH session, even though both SCP and SFTP use a secure SSH tunnel.

**NOTE:**

SSH authentication is mutually exclusive with RADIUS servers.

Some clients, such as PSCP (PuTTY SCP), automatically compare switch host keys for you. Other clients require you to manually copy and paste keys to the `$HOME/.ssh/known_hosts` file. Whatever SCP/SFTP software tool you use, after installing the client software you must verify that the switch host keys are available to the client. Because the third-party software utilities you may use for SCP/SFTP vary, you should refer to the documentation provided with the utility you select before performing this process.
SCP/SFTP operating notes

- Any attempts to use SCP or SFTP without using ip ssh filetransfer will cause the SCP or SFTP session to fail. Depending on the client software in use, you will receive an error message on the originating console, for example:

  IP file transfer not enabled on the switch

- There is a delay when SFTP is copying an image onto the switch, and although the command prompt returns in a couple of seconds, the switch may take approximately a minute and a half writing the image to flash. You can keep entering the show flash command to see when the copy is complete and the flash is updated. You can also check the log for an entry similar to the following:

  I 01/09/13 16:17:07 00150 update: Primary Image updated.

  I 01/09/13 16:13:22 00636 ssh: sftp session from 15.22.22.03

- When an SFTP client connects, the switch provides a file system displaying all of its available files and folders. No file or directory creation is permitted by the user. Files may be only uploaded or downloaded, according to the permissions mask. All of the necessary files the switch needs are already in place on the switch. You do not need to (nor can you) create new files.

- The switch supports one SFTP session or one SCP session at a time.

- All files have read-write permission. Several SFTP commands, such as create or remove, are not allowed and return an error message. The switch displays the following files:

```
/  
  +---cfg
  |     running-config
  |     startup-config
  +---log
  |     crash-data
  |     crash-data-a
  |     crash-data-b
  |     crash-data-c
  |     crash-data-d
  |     crash-data-e
  |     crash-data-f
  |     crash-data-g
  |     crash-data-h
  |     crash-data-I
  |     crash-data-J
  |     crash-data-K
  |     crash-data-L
  |     crash-log
  |     crash-log-a
  |     crash-log-b
  |     crash-log-c
  |     crash-log-d
  |     crash-log-e
  |     crash-log-f
  |     crash-log-g
  |     crash-log-h
  |     crash-log-I
  |     crash-log-J
  |     crash-log-K
  |     crash-log-L
  |     event log
  +---os
  |     primary
  |     secondary
  +---ssh
```
Troubleshooting SSH, SFTP, and SCP operations

Cause

You can verify secure file transfer operations by checking the switch's event log, or by viewing the error messages sent by the switch that most SCP and SFTP clients print out on their console.

NOTE: Messages that are sent by the switch to the client depend on the client software in use to display them on the user console.

Broken SSH connection

If an ssh connection is broken at the wrong moment (for instance, the link goes away or spanning tree brings down the link), a fatal exception occurs on the switch. If this happens, the switch gracefully exits the session and produces an Event Log message indicating the cause of failure. The following three examples show the error messages that may appear in the log, depending on the type of session that is running (SSH, SCP, or SFTP):

```
ssh: read error Bad file number, session aborted I 01/01/90 00:06:11 00636 ssh: sftp session from ::ffff:10.0.12.35 W 01/01/90 00:06:26 00641 ssh:
sftp read error Bad file number, session aborted I 01/01/90 00:09:54 00637 ssh: scp session from ::ffff:10.0.12.35 W 01/01/90
ssh: scp read error Bad file number, session aborted
```

NOTE: The Bad file number is from the system error value and may differ depending on the cause of the failure. In the third Example:, the device file to read was closed as the device read was about to occur.

Attempt to start a session during a flash write

If you attempt to start an SCP (or SFTP) session while a flash write is in progress, the switch does not allow the SCP or SFTP session to start. Depending on the client software in use, the following error message may appear on the client console:

```
Received disconnect from 10.0.12.31: 2: Flash access in progress lost connection
```

Failure to exit from a previous session

This next Example: shows the error message that may appear on the client console if a new SCP (or SFTP) session is started from a client before the previous client session has been closed (the switch requires approximately ten seconds to timeout the previous session):
Attempt to start a second session

The switch supports only one SFTP session or one SCP session at a time. If a second session is initiated (For example, an SFTP session is running and then an SCP session is attempted), the following error message may appear on the client console:

```
Received disconnect from 10.0.12.31: 2: Wait for previous session to complete
lost connection
```

Using Xmodem to download switch software from a PC or UNIX workstation

This procedure assumes that:

- The switch is connected via the Console RS-232 port to a PC operating as a terminal. (For information on connecting a PC as a terminal and running the switch console interface, see the installation and getting started guide you received with the switch.)
- The switch software is stored on a disk drive in the PC.
- The terminal emulator you are using includes the Xmodem binary transfer feature. (For example, in the HyperTerminal application included with Windows NT, you would use the Send File option in the Transfer drop-down menu.)

Downloading to primary or secondary flash using Xmodem and a terminal emulator (CLI)

Syntax:

```
copy xmodem flash [<primary | secondary>]
```

Downloads a software file to primary or secondary flash. If you do not specify the flash destination, the Xmodem download defaults to primary flash.

Example:

To download a switch software file named E0822.swi from a PC (running a terminal emulator program such as HyperTerminal) to primary flash:

**Procedure**

1. Execute the following command in the CLI:

   ```
   switch# copy xmodem flash
   Press 'Enter and start XMODEM on your host...
   ```

2. Execute the terminal emulator commands to begin the Xmodem transfer. For example, using HyperTerminal:

   a. Click on Transfer, then Send File.
   b. Type the file path and name in the Filename field.
c. In the Protocol field, select Xmodem.

d. Click on the [Send] button.

The download can take several minutes, depending on the baud rate used in the transfer.

3. When the download finishes, you must reboot the switch to implement the newly downloaded software. To do so, use one of the following commands:

**Syntax:**

```
boot system flash {<primary | secondary>}
```

Reboots from the selected flash

**Syntax:**

```
reload
```

Reboots from the flash image currently in use

For more information on these commands, see “Rebooting the Switches” in the basic operation guide for your switch.

4. To confirm that the software downloaded correctly:

```
switch# show system
```

Check the **Firmware revision** line. It should show the software version that you downloaded in the preceding steps.

If you need information on primary/secondary flash memory and the boot commands, see "Using Primary and Secondary Flash Image Options" in the basic operation guide for your switch.

**Switch-to-switch download**

You can use TFTP to transfer a software image between two switches of the same series. The CLI enables all combinations of flash location options.

**Downloading the OS from another switch (CLI)**

Where two switches in your network belong to the same series, you can download a software image between them by initiating a `copy tftp` command from the destination switch. The options for this CLI feature include:

- Copy from primary flash in the source to either primary or secondary in the destination.
- Copy from either primary or secondary flash in the source to either primary or secondary flash in the destination.

**Downloading from primary only (CLI)**

**Syntax:**

```
copy tftp flash <ip-addr> flash [primary | secondary]
```

When executed in the destination switch, downloads the software flash in the source switch's primary flash to either the primary or secondary flash in the destination switch.

If you do not specify either a primary or secondary flash location for the destination, the download automatically goes to primary flash.
To download a software file from primary flash in a switch with an IP address of 10.29.227.103 to the primary flash in the destination switch, you would execute the following command in the destination switch’s CLI:

```
switch# copy tftp flash 10.29.227.13 flash
Device will be rebooted, do you want to continue [y/n]? y
00107K
```

1Running Total of Bytes Downloaded

**Downloading from either flash in the source switch to either flash in the destination switch (CLI)**

**Syntax:**

```
copy tftp flash <ip-addr> {</os/primary> | </os/secondary>} [primary | secondary]
```

This command (executed in the destination switch) gives you the most options for downloading between switches. If you do not specify either a primary or secondary flash location for the destination, the download automatically goes to primary flash.

To download a software file from secondary flash in a switch with an IP address of 10.28.227.103 to the secondary flash in a destination switch, you would execute the following command in the destination switch’s CLI:

```
switch# copy tftp flash 10.29.227.13 flash /os/secondary secondary
Device will be rebooted, do you want to continue [y/n]? y
00184K
```

**Using AirWave to update switch software**

AirWave can be used to update switch products. For further information, refer to the ZTP with Airwave network Management chapter in this manual.

**Using IMC to update switch software**

IMC includes a software update utility for updating on switch products. For further information, refer to the getting started guide and the administrator’s guide, provided electronically with the application.

**Copying software images**

**NOTE:**

For details on how switch memory operates, including primary and secondary flash, see “Switch Memory and Configuration” in the basic operation guide for your switch.

**TFTP: Copying a software image to a remote host (CLI)**

**Syntax:**

```
copy flash tftp <ip-addr> <filename>
```

Copies the primary flash image to a TFTP server.

**Example:**
To copy the primary flash to a TFTP server having an IP address of 10.28.227.105:

```
switch# copy flash tftp 10.28.227.105 k0800.swi
```

where `k0800.swi` is the filename given to the flash image being copied.

**Xmodem: Copying a software image from the switch to a serially connected PC or UNIX workstation (CLI)**

To use this method, the switch must be connected via the serial port to a PC or UNIX workstation.

**Syntax:**

```
copy flash xmodem {<pc> | unix}
```

Uses Xmodem to copy a designated configuration file from the switch to a PC or UNIX workstation.

**Example:**

To copy the primary flash image to a serially connected PC:

**Procedure**

1. Execute the following command:

   ```
   switch# copy xmodem flash
   Press 'Enter' and start XMODEM on your host...
   ```

2. After you see the above prompt, press `[Enter]`.

3. Execute the terminal emulator commands to begin the file transfer.

**Copying diagnostic data**

**copy command-log**

**Syntax**

```
copy command-log {sftp | tftp | usb | xmodem}
```

**Description**

This command copies the Command Log content to a remote host or to a serially-connected PC or UNIX workstation.

- Use the `sftp` option to copy data to an SFTP server.
- Use the `tftp` option to copy data to a TFTP server.
- Use the `usb` option to copy data to a USB flash drive.
- Use the `xmodem` option to copy data to the console using XMODEM.

**copy event-log**

**Syntax**

```
copy event-log [tftp <IP-ADDRESS> <FILEPATH_FILENAME> [oobm]] [usb <FILENAME>] [xmodem <FILENAME>]
```

**Description**
These commands copy the Event Log content to a remote host, attached USB device, or to a serially connected PC or UNIX workstation.

**Parameters and options**

**oobm**

For switches that have a separate OOBM port, the `oobm` parameter specifies that the transfer is through the OOBM interface. If this parameter is not specified, the transfer is through the data interface. The `oobm` parameter is not available on switches that do not have a separate OOBM port.

---

**Copy the event log to a PC connected to the switch**

**Figure 36: Sending event log content to a file on an attached PC**

---

**Transferring switch configurations**

Using the CLI commands described in the section beginning with **TFTP: Copying a configuration file to a remote host (CLI)** on page 344, you can copy switch configurations to and from a switch, or copy a software image to configure or replace an ACL in the switch configuration.

---

**NOTE:**

For greater security, you can perform all TFTP operations using SFTP, as described in the section **Using SCP and SFTP** on page 334.

You can also use the `include-credentials` command to save passwords, secret keys, and other security credentials in the running config file. For more information, see the section on "Saving Security Credentials in a Config File" in the access security guide for your switch.

---

**TFTP: Copying a configuration file to a remote host (CLI)**

**Syntax:**

```
copy {<startup-config | running-config>} tftp <ip-addr> <remote-file> [pc | unix]

copy config <filename> tftp <ip-addr> <remote-file> [pc | unix]
```

This command can copy a designated config file in the switch to a TFTP server. For more information, see "Multiple Configuration Files" in the basic operation guide for your switch.

**Example:**

To upload the current startup configuration to a file named `sw8200` in the configs directory on drive "d" in a TFTP server having an IP address of 10.28.227.105:

```
switch# copy startup-config tftp 10.28.227.105
  d:\configs\sw8200
```
**TFTP: Copying a configuration file from a remote host (CLI)**

Syntax:

```
copy tftp {<startup-config | running-config> < ip-address > < remote-file >} [pc | unix]
copy tftp config <filename> <ip-address> <remote-file> [pc | unix]
```

This command can copy a configuration from a remote host to a designated config file in the switch. For more information, see "Multiple Configuration Files" in the basic operation guide for your switch.

For more information on flash image use, see "Using Primary and Secondary Flash Image Options" in the basic operation guide for your switch.

**Example:**

To download a configuration file named `sw8200` in the `configs` directory on drive "d" in a remote host having an IP address of 10.28.227.105:

```
switch# copy tftp startup-config 10.28.227.105
d:\configs\sw8200
```

**TFTP: Copying a customized command file to a switch (CLI)**

Using the `copy tftp` command with the `show-tech` option provides the ability to copy a customized command file to the switch. When the `show tech custom` command is executed, the commands in the custom file are executed instead of the hard-coded list of commands. If no custom file is found, the current hard-coded list is executed. This list contains commands to display data, such as the image stamp, running configuration, boot history, port settings, and so on.

Syntax:

```
copy tftp show-tech <ipv4 or ipv6 address> <filename>
```

Copies a customized command file to the switch (see Using the `copy tftp show-tech` command to upload a customized command file on page 345).

**Using the `copy tftp show-tech` command to upload a customized command file**

```
switch(config)# copy tftp show-tech 10.10.10.3 commandfile1
```

Syntax:

```
show tech custom
```

Executes the commands found in a custom file instead of the hard-coded list.

**NOTE:**

Exit the global config mode (if needed) before executing `show tech commands`.

You can include `show tech` commands in the custom file, with the exception of `show tech custom`. For example, you can include the command `show tech all`.

If no custom file is found, a message displays stating "No SHOW-TECH file found." (No custom file was uploaded with the `copy tftp show-tech` command.)
The show tech custom command

switch# show tech custom
No SHOW-TECH file found.

USB: Copying a configuration file to a USB device

Syntax:
copy startup-config usb <FILENAME>

This command can copy a designated config file in the switch to a USB device.

Example:
MyConfig is the name given to the configuration file that you copy from the switch to the USB device.

switch# copy startup-config usb MyConfig

USB: Copying a configuration file from a USB device

Syntax:
copy usb startup-config <FILENAME>

Description:
Copies a configuration file from a USB device to the startup configuration file on the switch. To execute the command, you must know the name of the file to copy.

Example:
MyConfig is the name given to the configuration file that you copy from the switch to the USB device.

switch# copy usb startup-config MyConfig

Xmodem: Copying a configuration file to a serially connected PC or UNIX workstation (CLI)

To use this method, the switch must be connected via the serial port to a PC or UNIX workstation. You will need to:

- Determine a filename to use
- Know the directory path you will use to store the configuration file.

Syntax:
copy {<startup-config | running-config>} xmodem {<pc | unix>}
copy config <filename> xmodem {<pc | unix>}

Uses Xmodem to copy a designated configuration file from the switch to a PC or UNIX workstation. For more information, see "Multiple Configuration Files" in the basic operation guide for your switch.

Example:
To copy a configuration file to a PC serially connected to the switch:

1. Determine the file name and directory location on the PC.
2. Execute the following command:
3. After you see the above prompt, press [Enter].

4. Execute the terminal emulator commands to begin the file transfer.

**Xmodem: Copying a configuration file from a serially connected PC or UNIX workstation (CLI)**

To use this method, the switch must be connected via the serial port to a PC or UNIX workstation on which is stored the configuration file you want to copy. To complete the copying, you need to know the name of the file to copy and the drive and directory location of the file.

**Syntax:**

```plaintext
copy xmodem startup-config {<pc | unix>}

copy xmodem config <filename> < {pc | unix}>
```

Copies a configuration file from a serially connected PC or UNIX workstation to a designated configuration file on the switch.

For more information, see "Multiple Configuration Files" in the basic operation guide for your switch.

**Example:**

To copy a configuration file from a PC serially connected to the switch:

**Procedure**

1. Execute the following command:

   ```plaintext
   switch# copy xmodem startup-config pc
   Device will be rebooted, do you want to continue [y/n]? y
   Press 'Enter' and start XMODEM on your host...
   ```

2. After you see the above prompt, press [Enter].

3. Execute the terminal emulator commands to begin the file transfer.

4. When the download finishes, you must reboot the switch to implement the newly downloaded software. To do so, use one of the following commands:

   **Syntax:**

   ```plaintext
   boot system flash [primary | secondary]
   ```

   ```plaintext
   boot system flash [config < filename >]
   ```

   Switches boot from the designated configuration file. For more information, see "Multiple Configuration Files" in the basic operation guide for your switch.

   **Syntax:**

   ```plaintext
   reload
   ```

   Reboots from the flash image currently in use.
Transferring ACL command files

This section describes how to upload and execute a command file to the switch for configuring or replacing an ACL in the switch configuration. Such files should contain only access control entry (ACE) commands. For more on this general topic, including an Example: of an ACL command file created offline, see the section "Editing ACLs and Creating an ACL Offline" in the "Access Control Lists (ACLs)" of the latest access security guide for your switch.

**TFTP: Uploading an ACL command file from a TFTP server (CLI)**

**Syntax:**

```
copy tftp command-file <ip-addr> <filename.txt> {<unix | pc>}
```

Copies and executes the named text file from the specified TFTP server address and executes the ACL commands in the file.

| **<ip-addr>** | The IP address of a TFTP server available to the switch |
| **<filename.txt>** | A text file containing ACL commands and stored in the TFTP directory of the server identified by *ip-addr* |
| **{<unix | pc>** | The type of workstation used for serial, Telnet, or SSH access to the switch CLI |

Depending on the ACL commands used, this action does one of the following in the running-config file:

- Creates a new ACL.
- Replaces an existing ACL. (See "Creating an ACL Offline" in the "Access Control Lists (ACLs)" in the latest access security guide for your switch.)
- Adds to an existing ACL

**Example:**

Suppose you:

- Created an ACL command file named *vlan10_in.txt* to update an existing ACL.
- Copied the file to a TFTP server at 18.38.124.16.

Using a PC workstation, you then execute the following from the CLI to upload the file to the switch and implement the ACL commands it contains:

```
switch(config)# copy tftp command-file 18.38.124.16 vlan10_in.txt pc
```

The switch displays this message:

```
Running configuration may change, do you want to continue [y/n]?
```

To continue with the upload, press the [Y] key. To abort the upload, press the [N] key. Note that if the switch detects an illegal (non-ACL) command in the file, it bypasses the illegal command, displays a notice (as shown in
Figure 37: Using the copy command to download and configure an ACL on page 349), and continues to implement the remaining ACL commands in the file.

**Figure 37: Using the copy command to download and configure an ACL**

```
switch(config)# copy tftp command-file 10.38.124.18 vlan10_in.txt pc
Running configuration may change, do you want to continue [y/n]? y
1. ip access-list extended "155"
2. deny tcp 0.0.0.0 255.255.255.255 10.10.10.2 0.0.0.0 eq 23 log
3. permit ip 0.0.0.0 255.255.255.255 0.0.0.0 255.255.255.255
4. show running
Command files are limited to access-list commands. ¹
5. exit
Switch(config)# show running ²
Running configuration:

; J9091A Configuration Editor; Created on release #W.15.05.0000x
; Ver #01:01:00

hostname "Switch"
cdp run
ip default-gateway 10.38.248.1
logging 10.38.227.2
snmp-server community "public" unrestricted
ip access-list extended "155"
deny tcp 0.0.0.0 255.255.255.255 10.10.10.2 0.0.0.0 eq 23 log
permit ip 0.0.0.0 255.255.255.255 0.0.0.0 255.255.255.255
exit

¹This message indicates that the show running command just above it is not an ACL command and will be ignored by the switch.

²Manually executing the show running from the CLI indicates that the file was implemented, creating ACL 155 in the switch's running configuration.

**Xmodem: Uploading an ACL command file from a serially connected PC or UNIX workstation (CLI)**

**Syntax:**

```
copy xmodem command-file {<unix | pc} 
```

Uses Xmodem to copy and execute an ACL command from a PC or UNIX workstation. Depending on the ACL commands used, this action does one of the following in the running-config file:

- Creates a new ACL.
- Replaces an existing ACL. (See "Creating an ACL Offline" in the "Access Control Lists (ACLs)" in the latest access security guide for your switch.)
- Adds to an existing ACL.

**Single copy command**

When a switch crashes, five files relating to the crash; core-dump, crash-data, crash-log, fdr-log, and event-log are created and should be copied for review. All five files (core-dump, crash-data, crash-log, fdr-log, and event-log) should be copied to a destination specified under a directory by file name.
TFTP

A destination directory and files can be created for all crash files (core-dump, crash-data, crash-log, fdr-log, and event-log) on an TFTP server (with write permissions).

SFTP

Files are auto created on the SFTP server as a secured transfer. The destination directories however can be manually created on the server.

NOTE: Specified directories can be used for the TFTP/SFTP transfers in the `copy` command. If the directory is specified, all files will be copied under one directory, otherwise all files will be copied to the TFTP/SFTP server home directory. It is mandatory to specify the directory name.

**Single copy command**

**Syntax**

`copy source destination options`

Copy data files to and from the switch.

**Source**

Specify the source of data using any of the following destinations.

<table>
<thead>
<tr>
<th>Destination</th>
<th>Operation note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flash</td>
<td>n/a</td>
</tr>
<tr>
<td>SFTP</td>
<td>For transfer of crash-files via SFTP, the destination directory must exist on the SFTP server with write permissions. File creation is not mandatory as files are automatically created with the chassis serial number suffix to the filename when using SFTP.</td>
</tr>
<tr>
<td>TFTP</td>
<td>For transfer of crash-files via TFTP, the destination directory along with the file names (core-dump, crash-data, crash-log, fdr-log, and event-log) must exist on the TFTP server with write permissions.</td>
</tr>
<tr>
<td>Xmodem</td>
<td>n/a</td>
</tr>
</tbody>
</table>

**Data Files**

Specify the data file to be copied from the source.

<table>
<thead>
<tr>
<th>Data file</th>
<th>Operation note</th>
</tr>
</thead>
<tbody>
<tr>
<td>command-output command</td>
<td>Specify a command to copy output. When using <code>command-output</code>, place the desired CLI command in double-quotes. For example: &quot;show system&quot;.</td>
</tr>
<tr>
<td>config file-name</td>
<td>Copy named configuration file. The <code>file-name</code> option is the source configuration file being copied.</td>
</tr>
</tbody>
</table>

*Table Continued*
<table>
<thead>
<tr>
<th>Data file</th>
<th>Operation note</th>
</tr>
</thead>
<tbody>
<tr>
<td>core-dump</td>
<td>Copy core-dump file from flash.</td>
</tr>
<tr>
<td>crash-data</td>
<td>Copy the switch crash-data file.</td>
</tr>
<tr>
<td>crash-log a</td>
<td>b</td>
</tr>
<tr>
<td>crash-files</td>
<td>Copy core-dump, crash-data, crash-log, fdr-log, and event-log files to an SFTP/TFTP server, or xmodem terminal. When using the crash-files option, the destination directory alone must be specified as the destination path. Specifying the file names is not mandatory.</td>
</tr>
<tr>
<td>default-config</td>
<td>Copy custom default-config file.</td>
</tr>
<tr>
<td>event-log</td>
<td>Copy event-log file.</td>
</tr>
<tr>
<td>fdr-log</td>
<td>Copy FDR-og file from the switch to an SFTP/TFTP server or xmodem terminal.</td>
</tr>
<tr>
<td>flash</td>
<td>Copy the switch system image file.</td>
</tr>
<tr>
<td>SFTP server</td>
<td>Copy data from a SFTP server.</td>
</tr>
<tr>
<td>startup-config</td>
<td>Copy in-flash configuration file.</td>
</tr>
<tr>
<td>ssh-client-known-hosts</td>
<td>Copy the known hosts file.</td>
</tr>
<tr>
<td>ssh-server-pub-key</td>
<td>Copy the switch's SSH server public key.</td>
</tr>
<tr>
<td>running-config</td>
<td>Copy running configuration file.</td>
</tr>
<tr>
<td>TFTP</td>
<td>Copy data from a TFTP server.</td>
</tr>
<tr>
<td>xmodem</td>
<td>Use xmodem on the terminal as the data source.</td>
</tr>
</tbody>
</table>

**Destination**

Specify the copy target.

<table>
<thead>
<tr>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>SFTP</td>
</tr>
<tr>
<td>TFTP</td>
</tr>
<tr>
<td>USB (available only on the 2930M Switch Series)</td>
</tr>
<tr>
<td>xmodem</td>
</tr>
</tbody>
</table>
**Destination**

- SFTP
- TFTP
- xmodem

**Data Files**

Specify the data file name at the target.

<table>
<thead>
<tr>
<th>Data file</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>command file</td>
<td></td>
</tr>
<tr>
<td>config</td>
<td></td>

<td>flash</td>
<td></td>
</tr>
<tr>
<td>pub-key-file</td>
<td></td>
</tr>
<tr>
<td>show-tech</td>
<td></td>
</tr>
<tr>
<td>startup-config</td>
<td></td>
</tr>
<tr>
<td>ssh-client-key</td>
<td></td>
</tr>
<tr>
<td>ssh-client-known-hosts</td>
<td></td>
</tr>
</tbody>
</table>

**Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Operation note</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>append</td>
<td>Add the keys for operator access.</td>
<td>n/a</td>
</tr>
<tr>
<td>directory</td>
<td>Directory name to upload.</td>
<td>Required for TFTP and SFTP transfers.</td>
</tr>
<tr>
<td>filename</td>
<td>File-name to upload/download.</td>
<td>Required for TFTP and SFTP transfers.</td>
</tr>
<tr>
<td>hostname</td>
<td>Hostname of the TFTP, SFTP server.</td>
<td>Required for TFTP, SFTP transfers.</td>
</tr>
<tr>
<td>IPv4 address</td>
<td>TFTP, SFTP server IPv4 address.</td>
<td>Required for TFTP, SFTP transfers.</td>
</tr>
<tr>
<td>IPv6 address</td>
<td>TFTP, SFTP server IPv6 address.</td>
<td>Required for TFTP, SFTP transfers.</td>
</tr>
<tr>
<td>manager</td>
<td>Replace the keys for manager access; follow with the append option to add the keys.</td>
<td>n/a</td>
</tr>
</tbody>
</table>

<td>X</td>
</tr>
</tbody>
</table>

Crash file options

Syntax

copy crash-files crash-file-options host-name-str | ip-addr | ipv6-addr sftp dirname-str

Options

- **host-name-str**
  - Specify hostname of the SFTP server.

- **ip-addr**
  - Specify SFTP server IPv4 address.

- **ipv6-addr**
  - Specify SFTP server IPv6 address.

- **user**
  - Specify the username on the remote system.

- **username@ip-str**
  - Specify the username along with remote system. Information (hostname, IPv4 or IPv6 address).

- **dirname-str**
  - Specify the destination directory name.

Destination options

- **management**
  - Copy management crash files.

Flight Data Recorder (FDR)

The Flight Data Recorder (FDR) log collects information that is "interesting" when the switch is not performing correctly, but has not crashed. Runtime logs are written to FDR memory while the switch is running and crash-time logs are collected and stored in the FDR buffer during a switch crash.

Syntax:

copy fdr-log [[slot < slot-list >] | [mm-active [[current] | [previous]]] | [mm-standby] | [all]] tftp [[< hostname] | [ip-addr >]] <filename>
Copies `fdr-log` files to a user-specified file.

**all**

Copies all the log files from both management modules and all slots.

**mm-active**

Copies the active management module’s log.

**mm-standby**

Copies the standby management module’s log.

**slot**

Retrieves the crash log from the module in the identified slots.

---

### USB

**NOTE:** The USB port is available only on the 2930M Switch Series.

---

**usb-port**

**Syntax**

`usb-port`

`no usb-port`

**Description**

Enables the USB port.

The `no` form of the command disables the USB port and any access to the device.

**Command context**

`Config`

---

**show usb-port**

**Syntax**

`show usb-port`

**Description**

Displays the status of the USB port. It can be enabled, disabled, or not present.

**Command context**

`operator`

---

**Usage**

One of the following messages indicates the presence or absence of a USB device:

- `Not able to sense device in USB port`
- `USB device detected in port`
- `no USB device detected in port`
Example
Display USB port status.

```bash
switch# show usb-port
USB port status: enabled
USB port power status: power on    (USB device detected in port)
```

**Downloading switch software using USB**

**Prerequisites**

**Procedure**

1. Store a software version for the switch on a USB flash drive. (The latest software file is typically available from the Switch Networking website at [http://www.hpe.com/networking/support](http://www.hpe.com/networking/support).)
2. Insert the USB device into the switch’s USB port.
3. Determine the name of the software file stored on the USB flash drive (for example, K.0800.swi).
4. Decide whether the image will be installed in the primary or secondary flash.

**Copying using USB**

To copy the primary image to a USB flash drive:

**Procedure**

1. Insert a USB device into the switch’s USB port.
2. Execute the command: `switch# copy flash usb K.0800.swi primary/secondary` where `K.0800.swi` is the name given to the primary flash image that is copied from the switch to the USB device.

**copy flash usb**

**Syntax**

`copy flash usb <FILENAME>`

**Description**

Uses the USB port to copy the specified flash image from the switch to a USB flash memory device. The default setting will use the primary image.

Copy a switch software file named `K.0800.swi` from a USB device to primary flash.
Procedure

1. Issue the `copy usb flash` command as shown below:

   **Figure 38: The command to copy switch software from USB**

   ```
   Switch# copy usb flash K.0800.swi
   The Primary OS Image will be deleted, continue [y/n]? y
   ```

   This message means that the image you want to upload will replace the image currently in primary flash.

2. When the switch finishes copying the software file from the USB device, it displays this progress message:

   Validating and Writing System Software to the Filesystem....

3. When the save finishes, you must reboot the switch to load the newly loaded software.

4. To confirm that the software downloaded correctly, execute `show system` and check the **Software revision** line.

**copy usb command-file**

**Syntax**

`copy usb command-file <FILENAME.TXT> [unix|pc]`

**Description**

Copies and executes the named text file from a USB flash drive and executes the ACL commands in the file. Depending on the ACL commands used, this action does one of the following in the running-config file:

- Creates a new ACL.
- Replaces an existing ACL.
- Adds to an existing ACL.

**Parameters**

- `<FILENAME.TXT>`
  - A text file containing ACL commands and stored in the USB flash drive.
- `unix|pc`
  - The type of workstation used to create the text file.

**Upload an ACL command file from USB**

Using a PC workstation, execute the following from the CLI to upload the file to the switch and implement the ACL commands it contains:

```
switch(config)# copy usb command-file vlan10_in.txt pc
```

The switch displays this message:

```
Running configuration may change, do you want to continue [y/n]? 
```
If the switch detects an illegal (non-ACL) command in the file, it bypasses the illegal command, displays a notice, and continues to implement the remaining ACL commands in the file.
Overview

The switches have several built-in tools for monitoring, analyzing, and troubleshooting switch and network operation:

- **Status**: Includes options for displaying general switch information, management address data, port status, port and trunk group statistics, MAC addresses detected on each port or VLAN, and STP, IGMP, and VLAN data.

- **Counters**: Display details of traffic volume on individual ports.

- **Event Log**: Lists switch operating events ([Using the Event Log for troubleshooting switch problems](#) on page 474).

- **Alert Log**: Lists network occurrences detected by the switch—in the System > Logging screen of the WebAgent.

- **Configurable trap receivers**: Uses SNMP to enable management stations on your network to receive SNMP traps from the switch.

- **Port monitoring (mirroring)**: Copy all traffic from the specified ports to a designated monitoring port.

**NOTE**: Link test and ping test—analysis tools in troubleshooting situations—are described in [Troubleshooting](#) on page 444. See [Diagnostic tools](#) on page 513.

Switch and network operations

The switches have several built-in tools for monitoring, analyzing, and troubleshooting switch and network operation:

- **Status**
  
  Includes options for displaying general switch information, management address data, port status, port and trunk group statistics, MAC addresses detected on each port or VLAN, and STP, IGMP, and VLAN data.

- **Counters**
  
  Display details of traffic volume on individual ports.

- **Event Log**
  
  Lists switch operating events. See the ProVision switch software troubleshooting guide for troubleshooting information.

- **Configurable trap receivers**
  
  Uses SNMP to enable management stations on your network to receive SNMP traps from the switch.

- **Port monitoring (mirroring)**
  
  Copy all traffic from the specified ports to a designated monitoring port.

**NOTE**: Link test and ping test—analysis tools in troubleshooting situations—are described in the *ProVision Switch Software Troubleshooting Guide*. 
Status and counters data

This section describes the status and counters screens available through the switch console interface and/or the WebAgent.

NOTE: You can access all console screens from the WebAgent via Telnet to the console. Telnet access to the switch is available in the Device View window under the Configuration tab.

show system

Syntax

show system [chassislocate|information|fans]

Description

Displays global system information and operational parameters for the switch.

Parameters and options

chassislocate

Displays the chassisLocator LED status. Possible values are ON, Off, or Blink. When the status is On or Blink, the number of minutes that the Locator LED will continue to be on or to blink is displayed. (See Figure 39: Command results for show system chassislocate command on page 361.)

information

Displays global system information and operational parameters for the switch. (See Figure 41: Switch system information on page 361.)

power-supply

Shows chassis power supply and settings.

temperature

Shows system temperature and settings.

fans

Shows system fan status. (See Figure 40: System fan status on page 361.)
show system chassislocate command

Figure 39: Command results for show system chassislocate command

```
Switch(config)# show system chassislocate
Chassis Locator LED: ON 5 minutes 5 seconds
Switch(config)# show system chassislocate
Chassis Locator LED: BLINK 10 minutes 6 seconds
Switch(config)# show system chassislocate
Chassis Locator LED: OFF
```

Figure 40: System fan status

```
Switch(config)# show system fans
Fan Information
   Num | State    | Failures
--------+----------+----------
   Sys-1 | Fan OK   | 0
0 / 1 Fans in Failure State
0 / 1 Fans have been in Failure State
```

   Pkts Tx : 0
```

chassislocate

Syntax

description

Identifies the location of a specific switch by activating the blue locator LED on the front panel of the switch.

chassislocate [blink|on|off]

Parameters and options
Blinks the chassis locate LED for a specified number of minutes (Default: 30 min.)

Blinks the chassis locate LED for a specified number of minutes (Default: 30 min.)

Turns the chassis locate LED on for a specified number of minutes (Default: 20 min.)

Turns the chassis locate LED off.

**Chassislocate at startup**

The chassislocate command has an optional parameter that configures it to run in the future instead of immediately.

**Syntax**

```
chassislocate [on|blink] <MINUTES> at [now|startup]
chassislocate off
```

**Parameters and options**

- `<MINUTES>`: Specify the number of minutes for the chassis locate LED to remain on or blink.
- `at`: Specify when the command is applied (default immediately.)
  - `now`: Turn on the chassis locate LED immediately.
  - `startup`: Turn on the chassis locate LED at switch startup.
- `off`: Turn off the chassis locate LED switch

---

**chassislocate at startup**

```
chassislocate blink 10 at startup
```

**show system chassislocate**

**Syntax**

```
show system chassislocate
```

**Description**

Displays the current status of the `chassislocate` settings.

---

**Display locator LED status**

<table>
<thead>
<tr>
<th>Member</th>
<th>State</th>
<th>Remaining Time</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>blink</td>
<td>00:27:05</td>
<td>blink 30 at startup</td>
</tr>
</tbody>
</table>
General system information

Accessing system information (CLI)

Syntax:

```bash
show system [chassislocate | information | fans | power-supply | temperature]
```

Displays global system information and operational parameters for the switch.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chassislocate</td>
<td>Shows the chassisLocator LED status. Possible values are On, Off, or Blink. When the status is On or Blink, the number of minutes that the Locator LED will continue to be on or to blink is displayed. (See Command results for show system chassislocate command on page 363)</td>
</tr>
<tr>
<td>information</td>
<td>Shows global system information and operational parameters for the switch. (See Switch system information on page 363.)</td>
</tr>
<tr>
<td>fans</td>
<td>Shows system fan status. (See System fan status on page 363.)</td>

</tbody>
</table>

Command results for show system chassislocate command

```bash
switch(config)# show system chassislocate
Chassis Locator LED: ON 5 minutes 5 seconds
switch(config)# show system chassislocate
Chassis Locator LED: BLINK 10 minutes 6 seconds
switch(config)# show system chassislocate
Chassis Locator LED: OFF
```

System fan status

```bash
switch(config)# show system fans
Fan Information
  Num | State | Failures
-------+-------------+----------
Sys-1 | Fan OK | 0
0 / 1 Fans in Failure State
0 / 1 Fans have been in Failure State
```

Switch system information

```bash
switch(config)# show system
Status and Counters - General System Information
```

Chapter 12 Monitoring and Analyzing Switch Operation 363
Collecting processor data with the task monitor (CLI)

The task monitor feature allows you to enable or disable the collection of processor utilization data. The `task-monitor cpu` command is equivalent to the existing debug mode command `taskusage -d`.

When the `task-monitor` command is enabled, the `show cpu` command summarizes the processor usage by protocol and system functions.

**Syntax:**

```
[no] task-monitor cpu
```

Allows the collection of processor utilization data.

Only manager logins can execute this command.

The settings are not persistent, that is, there are no changes to the configuration.

(Default: Disabled)

The `task-monitor cpu` command and `show cpu` output

```
switch(config)# task-monitor cpu
switch(config)# show cpu

2 percent busy, from 2865 sec ago
1 sec ave: 9 percent busy
5 sec ave: 9 percent busy
1 min ave: 1 percent busy

% CPU | Description
-------+-----------------
99 | Idle
```

**task-monitor cpu**

**Syntax**

```
[no] task-monitor cpu
```

**Description**
Enables or disables the collection of processor utilization data, and requires a manager log in. Settings are not persistent; there are no changes to the configuration. Defaults to disabled.

**task-monitor cpu command**

**Figure 42:** The task-monitor cpu command and show cpu output

```plaintext
Switch(config)# task-monitor cpu
Switch(config)# show cpu

2 percent busy, from 2865 sec ago
1 sec ave: 9 percent busy
5 sec ave: 9 percent busy
1 min ave: 1 percent busy

% CPU | Description
---------------
 99 | Idle
```

**Switch management address information access**

**show management**

**Syntax**

show management

**Description**

Displays switch management address information.

**Component information views**

The CLI show modules command displays additional component information for the following:

- SSM—identification, including serial number
- Mini-GBICS—a list of installed mini-GBICs displaying the type, "J" number, and serial number (when available)

**show modules**

**Syntax**

show modules

**Description**

Displays information about the installed modules (**Figure 43:** The show modules command output on page 366), including:

- The slot in which the module is installed
- The module description
- The serial number
Additionally, this command displays the part number (J number) and serial number of the chassis. (See Figure 44: The show modules details command for the 8212zl, showing SSM and mini-GBIC information on page 366.)

**show modules command**

Figure 43: The show modules command output

```
Switch(config)# show modules

Status and Counters - Module Information

<table>
<thead>
<tr>
<th>Chassis: 5406zl J8697A</th>
<th>Serial Number:</th>
<th>Serial Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slot</td>
<td>Module Description</td>
<td></td>
</tr>

**Task usage reporting**

The task usage reporting feature provides the ability to collect and display CPU usage data (with a refresh rate of 5 seconds) of running tasks on the switch. It includes the following commands:

- **process-tracking**: This command is used to enable/disable the task-usage collecting capability for a specific module on the switch.
- **show cpu process**: This command is used to display task-usage statistics for a specific module.

**Syntax:**

366 Aruba 2930F / 2930M Management and Configuration Guide for ArubaOS-Switch 16.07
[no] process-tracking [slot[SLOT-LIST] [<time>]] [<time>]

Enables/disables module process-tracking functionality.

process-tracking <tab>

<table>
<thead>
<tr>
<th>slot</th>
<th>Enables/disables process-tracking for a module.</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>Specifies time to track value between 1 second to 30 seconds.</td>
</tr>
</tbody>
</table>

process-tracking slot <tab>

| SLOT-ID-RANGE | Enter an alphabetic device slot identifier or slot range. |

process-tracking slot A

| INTEGER | Specifies time to track value between 1 second to 30 seconds. |

process-tracking slot A 10 <tab>

Syntax:

show cpu [<CHASSIS_MIN_CPU_UTIL_INDEX-CHASSIS_MAX_CPU_UTIL_INDEX>]
[<CHASSIS_MIN_CPU_UTIL_INDEX-CHASSIS_MODULE_MAX_CPU_UTIL_INDEX>]
[process [[slot <SLOT-LIST>] [refresh <iterations>]]]
[refresh <iterations>]

Shows average CPU utilization over the last 1, 5, and 60 seconds, or the number of seconds specified. Use the slot option to display CPU utilization for the specified modules, rather than the chassis CPU. Use the process option to display module process usages.

Syntax:

show cpu process [slot [SLOT-LIST][refresh <iterations>]]
[refresh <iterations>]

Displays module process usage.

show cpu <tab>

| process | Displays process usage. |
| slot    | Displays module CPU statistics. |
show cpu process <tab>

refresh | Number of times to refresh process usage display.

slot | Displays module process usage.

show cpu process refresh <tab>

</table>

Output for the show cpu process slot <slot-list> command

switch# show cpu process slot A

slot a:
Switch management address information

Accessing switch management address information (CLI)

Syntax:

show management

Overview of MAC Address Management

The switch assigns MAC addresses in these areas:

- For management functions, one Base MAC address is assigned to the default VLAN (VID = 1). (All VLANs on the switches covered in this guide use the same MAC address.)
- For internal switch operations: One MAC address per port (see Viewing the port and VLAN MAC addresses on page 370).

MAC addresses are assigned at the factory. The switch automatically implements these addresses for VLANs and ports as they are added to the switch.

NOTE: The switch’s base MAC address is also printed on a label affixed to the switch.

Determining MAC addresses

Use the CLI to view the switch’s port MAC addresses in hexadecimal format.

NOTE: The switch's base MAC address is used for the default VLAN (VID =1) that is always available on the switch. This is true for dynamic VLANs as well; the base MAC address is the same across all VLANs.

Viewing the MAC addresses of connected devices

Syntax:

show mac-address [port-list | mac-addr | vlan < vid>]

Lists the MAC addresses of the devices the switch has detected, along with the number of the specific port on which each MAC address was detected.
[port-list] Lists the MAC addresses of the devices the switch has detected, on the specified ports.

[mac-addr] Lists the port on which the switch detects the specified MAC address. Returns the following message if the specified MAC address is not detected on any port in the switch:

MAC address <mac-addr> not found.

[vlan <vid>] Lists the MAC addresses of the devices the switch has detected on ports belonging to the specified VLAN, along with the number of the specific port on which each MAC address was detected.

---

### Viewing the switch's MAC address assignments for VLANs configured on the switch

The Management Address Information screen lists the MAC addresses for:

- Base switch (default VLAN; VID=1)
- Any additional VLANs configured on the switch.

Also, the Base MAC address appears on a label on the back of the switch.

---

**NOTE:** The Base MAC address is used by the first (default) VLAN in the switch. This is usually the VLAN named "DEFAULT_VLAN" unless the name has been changed (by using the VLAN Names screen). On the switches covered in this guide, the VID (VLAN identification number) for the default VLAN is always "1," and cannot be changed.

---

### Viewing the port and VLAN MAC addresses

The MAC address assigned to each switch port is used internally by such features as Flow Control and the spanning-tree protocol. Using the walkmib command to determine the MAC address assignments for individual ports can sometimes be useful when diagnosing switch operation.

---

**NOTE:** This procedure displays the MAC addresses for all ports and existing VLANs in the switch, regardless of which VLAN you select.

---

### Procedure

1. If the switch is at the CLI Operator level, use the `enable` command to enter the Manager level of the CLI.
2. Enter the following command to display the MAC address for each port on the switch:

```
switch# walkmib ifPhysAddress
```

(The above command is not case-sensitive.)

---

### Example:

A switch with the following module configuration shows MAC address assignments similar to those shown in the example below:
• A 4-port module in slot A, a 24-port module in slot C, and no modules in slots B and D
• Two non-default VLANs configured

Figure 45: Example of Port MAC address assignments on a switch

<table>

</tbody>
</table>

Port Status

The WebAgent and the console interface show the same port status data.

Viewing port status (CLI)

Syntax:

show interfaces brief

Viewing port and trunk group statistics (WebAgent)

1. In the navigation pane of the WebAgent, click Interface.
2. Click Port Info/Config.

For information about this screen, click ? in the upper right corner of the WebAgent screen.
To reset the port counters to zero, you must reboot the switch.

Port and trunk group statistics and flow control status

The features described in this section enable you to determine the traffic patterns for each port since the last reboot or reset of the switch. You can display:

- A general report of traffic on all LAN ports and trunk groups in the switch, along with the per-port flow control status (On or Off).
- A detailed summary of traffic on a selected port or trunk group.

You can also reset the counters for a specific port.

The menu interface provides a dynamic display of counters summarizing the traffic on each port. The CLI lets you see a static "snapshot" of port or trunk group statistics at a particular moment.

As mentioned above, rebooting or resetting the switch resets the counters to zero. You can also reset the counters to zero for the current session. This is useful for troubleshooting. See the Note, below.

NOTE:
The Reset action resets the counter display to zero for the current session, but does not affect the cumulative values in the actual hardware counters. (In compliance with the SNMP standard, the values in the hardware counters are not reset to zero unless you reboot the switch.) Exiting from the console session and starting a new session restores the counter displays to the accumulated values in the hardware counters.

Accessing port and trunk group statistics (CLI)

Viewing the port counter summary report

Syntax:

```
show interfaces
```

Provides an overview of port activity for all ports on the switch.

Viewing a detailed traffic summary for specific ports

Syntax:

```
show interfaces <port-list>
```

Provides traffic details for the ports you specify.

Displaying trunk load balancing statistics

To display trunk counters information since the trunk was formed with the given ports. If ports are added or removed from the trunk-groups, statistical data is reset.

Syntax:

```
show trunk-statistics <trunk-group>
```

Displays the trunk counter information since the trunk was formed.
Output for the show trunk-statistics command

```
switch(config)# show trunk-statistics trk1
Group : Trk1 Ports : 3,4
Monitoring time : 23 hours 15 minutes

Totals

Packets Rx : 3,452,664 Bytes Rx : 14,004,243
Packets Tx : 2,121,122 Bytes Tx : 2,077,566
Packets Tx Drop :

Rates (5 minute weighted average):
Trunk utilization Rx : 30.2 %
Trunk utilization Tx : 78.2 %

Traffic Spread past 5 minutes

<table>
<thead>

<td>73</td>
<td>58</td>
<td>356,233</td>
<td>993,222</td>
<td>0</td>
</tr>
</tbody>
</table>
```

Clearing trunk load balancing statistics

To display trunk counters information since the trunk was formed with the given ports. If ports are added or removed from the trunk-groups, statistical data is reset. The data is for a specific trunk.

**Syntax:**

clear trunk-statistics <trunk-group>

Clears statistics for all trunks if no trunks identified.

**trunk-group:** Clears specific trunk counter information since the trunk was formed.

Resetting the port counters

It is useful to be able to clear all counters and statistics without rebooting the switch when troubleshooting network issues. The **clear statistics global** command clears all counters and statistics for all interfaces except SNMP. You can also clear the counters and statistics for an individual port using the **clear statistics <port-list>** command.

**Syntax:**

```
clear statistics {<< port-list > | global>}
```

When executed with the **port-list** option, clears the counters and statistics for an individual port.

When executed with the **global** option, clears all counters and statistics for all interfaces except SNMP.

The **show interfaces [<port-list>]** command displays the totals accumulated since the last boot or the last **clear statistics command** was executed. The menu page also displays these totals.

SNMP displays the counter and statistics totals accumulated since the last reboot; it is not affected by the **clear statistics global** command or the **clear statistics <port-list>** command. An SNMP trap is sent whenever the statistics are cleared.

Viewing the switch's MAC address tables
Accessing MAC address views and searches (CLI)

Syntax:

show mac-address
[vlan < vlan-id>]
[<port-list>]
[< mac-addr >]

Listing all learned MAC addresses on the switch, with the port number on which each MAC address was learned

Switch# show mac-address

Listing all learned MAC addresses on one or more ports, with their corresponding port numbers

For example, to list the learned MAC address on ports A1 through A4 and port A6:

Switch# show mac-address a1-a4,a6

Listing all learned MAC addresses on a VLAN, with their port numbers

This command lists the MAC addresses associated with the ports for a given VLAN. For Example:

Switch# show mac-address vlan 100

NOTE: The switches operate with a multiple forwarding database architecture.

Finding the port on which the switch learned a specific MAC address

For example, to find the port on which the switch learns a MAC address of 080009-21ae84:

Select VLAN: [DEFAULT VLAN]

Accessing MSTP Data (CLI)

Syntax:

show spanning-tree

Displays the switch's global and regional spanning-tree status, plus the per-port spanning-tree operation at the regional level.

Values for the following parameters appear only for ports connected to active devices: Designated Bridge, Hello Time, PtP, and Edge.
Example:

Figure 46: Output from `show spanning-tree` command

```
Switch(config)# show spanning-tree

Multiple Spanning Tree (MST) Information
<table>
<thead>
<tr>
<th>STP Enabled</th>
<th>Force Version</th>
<th>IST Mapped VLANs</th>

</tr>
</tbody>
</table>
```

Viewing internet IGMP status (CLI)

The switch uses the CLI to display the following IGMP status on a per-VLAN basis:
Viewing VLAN information (CLI)

<table>
<thead>
<tr>
<th>Show command</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vlan</td>
<td>Lists:</td>
</tr>
<tr>
<td></td>
<td>• Maximum number of VLANs to support</td>
</tr>
<tr>
<td></td>
<td>• Existing VLANs</td>
</tr>
<tr>
<td></td>
<td>• Status (static or dynamic)</td>
</tr>
<tr>
<td></td>
<td>• Primary VLAN</td>
</tr>
<tr>
<td>show vlan &lt;vlan-id&gt;</td>
<td>For the specified VLAN, lists:</td>
</tr>
<tr>
<td></td>
<td>• Name, VID, and status (static/dynamic)</td>
</tr>
<tr>
<td></td>
<td>• Per-port mode (tagged, untagged, forbid, no/auto)</td>
</tr>
<tr>
<td></td>
<td>• &quot;Unknown VLAN&quot; setting (Learn, Block, Disable)</td>
</tr>
<tr>
<td></td>
<td>• Port status (up/down)</td>
</tr>
</tbody>
</table>

Example:

Suppose that your switch has the following VLANs:

<table>
<thead>
<tr>
<th>Ports</th>
<th>VLAN</th>
<th>VID</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1-A12</td>
<td>DEFAULT_VLAN</td>
<td>1</td>
</tr>
<tr>
<td>A1, A2</td>
<td>VLAN-33</td>
<td>33</td>
</tr>
<tr>
<td>A3, A4</td>
<td>VLAN-44</td>
<td>44</td>
</tr>
</tbody>
</table>

The next three examples show how you could list data on the above VLANs.

Listing the VLAN ID (vid) and status for specific ports

Switch# show vlan ports A1-A2

Status and Counters = VLAN Information - for ports A1,A2

<table>
<thead>
<tr>
<th>802.1Q VLAN ID Name</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DEFAULT_VLAN Static</td>
</tr>
<tr>
<td>33</td>
<td>VLAN-33 Static</td>
</tr>
</tbody>
</table>

Note: Because ports A1 and A2 are not members of VLAN-44, it does not appear in this listing.

VLAN listing for the entire switch

Switch# show vlan

Status and Counters = VLAN Information

VLAN support : Yes
Maximum VLANs to support : 9
Primary VLAN: DEFAULT_VLAN
Port listing for an individual VLAN

switch(config)# show vlan 1

Status and Counters - VLAN Information - VLAN 1

VLAN ID : 1
Name : DEFAULT_VLAN
Status : Static
Voice : Yes
Jumbo : No

<table>
<thead>
<tr>
<th>Port Information</th>
<th>Mode</th>
<th>Unknown VLAN</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>Untagged Learn</td>
<td>Up</td>
<td></td>
</tr>
<tr>
<td>A2</td>
<td>Untagged Learn</td>
<td>Up</td>
<td></td>
</tr>
<tr>
<td>A3</td>
<td>Untagged Learn</td>
<td>Up</td>
<td></td>
</tr>
<tr>
<td>A4</td>
<td>Untagged Learn</td>
<td>Down</td>
<td></td>
</tr>
<tr>
<td>A5</td>
<td>Untagged Learn</td>
<td>Up</td>
<td></td>
</tr>
<tr>
<td>A6</td>
<td>Untagged Learn</td>
<td>Up</td>
<td></td>
</tr>
<tr>
<td>A7</td>
<td>Untagged Learn</td>
<td>Up</td>
<td></td>
</tr>
</tbody>
</table>
WebAgent status information

The WebAgent Status screen provides an overview of the status of the switch. Scroll down to view more details. For information about this screen, click on ? in the upper right corner of the WebAgent screen. For an Example: of a status screen, see Figure 47: Example: of a WebAgent status screen on page 378.

Figure 47: Example: of a WebAgent status screen

Compatibility mode for v2 zl and zl modules

In the following context, v2 zl modules are the second version of the current zl modules.

Compatibility Mode allows the inter-operation of v2 zl modules with zl modules in a chassis switch. When in Compatibility Mode, the switch accepts either v2 zl or zl modules. The default is Compatibility Mode enabled. If Compatibility Mode is disabled by executing the no allow-v1-modules command, the switch will only power up v2 zl modules.

allow-v1-modules

Syntax

[no] allow-v1-modules

Enables Compatibility Mode for interoperation of v2 zl and zl modules in the same chassis. (See Figure 48: Enabling compatibility mode on page 378.) The no form of the command disables Compatibility Mode. Only the v2 zl modules are powered up. (See Figure 49: Disabling compatibility mode on page 379.) Defaults to enabled.

allow-v1–modules

Figure 48: Enabling compatibility mode

```
Switch(config)# allow-v1-modules
This will erase the configuration and reboot the switch.
Continue [y/n]?
```
Port status
You can view port status using either the CLI or the menu.

**show interfaces brief**

**Syntax**
show interfaces brief

**Description**
View the port status.

**Accessing port and trunk group statistics**
Use the CLI to view port counter summary reports, and to view detailed traffic summary for specific ports.

**Trunk bandwidth utilization**

- Trunk interface counters display the accumulated statistics over the trunk members' ports since the time they are added into trunk.
- Bandwidth utilization for trunks is calculated by averaging the value of the sum of bandwidth utilization for each trunk member in the last 5 minute interval.

**show interfaces**

**Syntax**
show interfaces [brief | config | <PORT-LIST>]

**Description**
Shows interface information for ports or trunk groups in brief or configuration detail.

**Command context**
operator or manager

**Parameters**

- **brief**
  Shows the current operating status for all ports or trunk groups on the switch in brief detail.
- **config**
  Shows the configuration data for all ports or trunk groups on the switch.
- **<PORT-LIST>**
  Specifies the list of ports for which status information will be shown.
Specifies the trunk group for which status information will be shown. The status information shown consists of total transmit and receive counters and weighted average rate for the trunk group specified. The weighted average rate is calculated in 5 minute intervals.

Usage
Both external and internal ports are supported on the same module. Internal ports have an “I” suffix in the output of the show command to indicate that they are internal ports.

• “10GbE-INT” – Internal 10G data-plane ports (1i-2i, 4i-5i)
• “1GbE-INT” – Internal 1G control-plane port (3i)
• Port 3i always shows as link-down.

Examples
Show brief information and status of all interfaces.

```
switch# show interfaces brief
```

<table>
<thead>
<tr>

Statistic interactions of interface counters

Table 25: Statistic interactions

Interface counters are cleared using the command clear statistics. When certain actions are taken to ports and trunks, the outcome of the clear command differs.

<table>
<thead>
<tr>
<th>Action taken</th>
<th>Trigger</th>
<th>Interaction with interface counter</th>
</tr>
</thead>
</table>
| Adding Port into trunk | CLI/SNMP | • Interface counters for this port will be cleared across all sessions.  
• Average rate counters are not cleared. |
| Removing Port from trunk | CLI/SNMP | • Interface counters for this port will be cleared across all sessions.  
• Average rate counters are not cleared. |
| Trunk port coming Up | CLI enable | • No change in counters.  
• Interface counters for this port are not cleared.  
• Average rate counters are not cleared. Counters will start from 0 when the trunk port comes up. |
| Trunk port coming Up | Cable connect | • No change in counters.  
• Interface counters for this port are not cleared.  
• Average rate counters are not cleared. Counters will start from 0 when the trunk port comes up. |
| Trunk port going Down | CLI disable | • Interface counters for this port are not cleared.  
• Average rate counters are cleared. |
| Trunk port going Down | Cable disconnect | • Interface counters for this port are not cleared.  
• Average rate counters are cleared. |

</tr>
</tbody>
</table>

**Reset port counters**

When troubleshooting network issues, you can clear all counters and statistics without rebooting the switch using the `clear statistics` global command or using the menu.

SNMP displays the counter and statistics totals accumulated since the last reboot, and it is not affected by the `clear statistics` global command or the `clear statistics <PORT-LIST>` command. Clearing statistics initiates an SNMP trap.

**IMPORTANT:** Once cleared, statistics cannot be reintroduced.

### clear statistics

**Syntax**

```
clear statistics [<PORT-LIST>|global]
```

**Description**

This command clears all counters and statistics for all interfaces except SNMP.

**Parameters and options**
Clears the counters and statistics for specific ports.

**global**

Clears all counters and statistics for all interfaces except SNMP.

## MAC address tables

### MAC address views and searches

You can view and search MAC addresses using the CLI or the menu.

**show mac-add detail**

**Syntax**

show mac-address detail

**Description**

Shows the age of the learned MAC addresses in the MAC table. The age of a specific MAC-address will be displayed in **dd:hr:min:sec.msec** format.

**Command context**

manager

**Examples**

show mac-add detail on a specified switch.

```
switch# show mac-add detail
```

**show mac-add detail** for platforms not supporting Vxlan Tunnels.
show mac-address

Syntax
show mac-address [vlan <VLAN-ID>] [PORT-LIST] [<MAC-ADDR>] [TUNNEL-ID]

Description
Lists all MAC addresses on the switch and their corresponding port numbers. You can also choose to list specific addresses and ports, or addresses and ports on a VLAN. The switches operate with a multiple forwarding database architecture.

Command context
manager

Parameters
vlan <VLAN-ID>
   Show MAC addresses learned on a specified VLAN.
PORT-LIST
   Show MAC addresses learned on the specified ports.
<MAC-ADDR>
   Show the specified port for a specified MAC address.
TUNNEL-ID
   Show MAC addresses learned on the specified VXLAN tunnel.

Usage
show mac-address
   Lists all learned MAC addresses on the switch and their corresponding port numbers.
show mac-address a1-a4,a6
   Lists all learned MAC addresses on one or more ports and their corresponding port numbers.
show mac-address vlan 100
   Lists all learned MAC addresses on a VLAN and their corresponding port numbers.

show mac-address <MAC-ADDRESS> detail

Syntax
show mac-address <MAC-ADDRESS> detail
Description
Specifies the age and existing details of the specific mac address given.

Parameters
<MAC-ADDRESS>
Specifies the mac-address being requested in detail.

Examples
Show mac-address detail for f0921c-b6e97e.

switch# show mac-address f0921c-b6e97e detail

<table>
<thead>
<tr>
<th>Status and Counters - Port Address Table</th>

Finding the port connection for a specific device on a VLAN
This feature uses a device's MAC address that you enter to identify the port used by that device.

Procedure
1. Proceeding from the figure above, press [S] (for Search ), to display the following prompt:

   Enter MAC address: _

2. Enter the MAC address you want to locate and press [Enter].

   The address and port number are highlighted if found. If the switch does not find the MAC address on the currently selected VLAN, it leaves the MAC address listing empty.

3. Press [P] (for Prev page ) to return to the full address table listing.

Determining whether a specific device is connected to the selected port
Proceeding from Step 2, above:

Procedure
1. Press [S] (for Search), to display the following prompt:

   Enter MAC address: _

2. Enter the MAC address you want to locate and press [Enter].
The address is highlighted if found. If the switch does not find the address, it leaves the MAC address listing empty.

3. Press [P] (for Prev page) to return to the previous per-port listing.

**MSTP data**

**show spanning-tree**

**Syntax**

```
show spanning-tree
```

**Description**

Displays the global and regional spanning-tree status for the switch, and displays the per-port spanning-tree operation at the regional level.

Values for the following parameters appear only for ports connected to active devices: Designated Bridge, Hello Time, PtP, and Edge.
show spanning-tree command output

**Figure 50: show spanning-tree command output**

```
Switch(config)# show spanning-tree

**Switch's Spanning Tree Configuration and Identity of VLANs Configured in the Switch for the IST Instance**

**Identifies the overall spanning-tree root for the network.**

**Lists the switch's MSTP root data for connectivity with other regions and STP or RSTP devices.**

**Identifies the spanning-tree root for the IST Instance for the region.**

**Internal Spanning Tree Data (IST Instance) for the region in which the Switch Operates**

**Identifies the ports with BPDU protection and BPDU filtering enabled.**

**Yes** means the switch is operating the port as if it is connected to a switch, bridge, or end node (but not a hub).

**For Edge, No (admin-edge-port operation disabled) indicates the port is configured for connecting to a LAN segment that includes a bridge or switch. Yes indicates the port is configured for a host (end node) link. Refer to the **configuring MSTP Per-Port Parameters** on page 3-24.
- VLAN ID (VID) and name
- Querier address
- Active group addresses per VLAN
- Number of report and query packets per group
- Querier access port per VLAN

**Parameters and options**

**config**

Displays the IGMP configuration information, including VLAN ID, VLAN name, status, forwarding, and Querier information.

**vlan-id**

Per-VLAN command listing above, IGMP status for specified VLAN (VID).

**group <IP-ADDR>**

Lists the ports currently participating in the specified group, with port type, Access type, Age Timer data and Leave Timer data.

**groups**

Displays VLAN-ID, group address, uptime, expiration time, multicast filter type, and the last reporter for IGMP groups.

**statistics**

Displays IGMP operational information, such as VLAN IDs and names, and filtered and flooding statistics.

### Output from show ip igmp config command

```
Switch(config)# show ip igmp config

IGMP Service

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>VLAN Name</th>
<th>IGMP Enabled</th>
<th>Forward with High Priority</th>
<th>Querier Allowed</th>
<th>Querier Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DEFAULT_VLAN</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>125</td>
</tr>
<tr>

<td>1</td>
</tr>
</tbody>
</table>
```
VLAN information

show vlan

Syntax
show vlan <VLAN-ID>

Description
Lists the maximum number of VLANs to support, existing VLANS, VLAN status (static or dynamic), and primary VLAN.

Parameters and options
<VLAN-ID>

Lists the following for the specified VLAN:

- Name, VID, and status (static/dynamic)
- Per-port mode (tagged, untagged, forbid, no/auto)
- "Unknown VLAN" setting (Learn, Block, Disable)
- Port status (up/down)

List data on specific VLANs
The next three figures show how you can list data for the following VLANs:

<table>
<thead>
<tr>
<th>Ports</th>
<th>VLAN</th>
<th>VID</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1-A12</td>
<td>DEFAULT_VLAN</td>
<td>1</td>
</tr>
</tbody>
</table>

Table Continued
Figure 51: Listing the VLAN ID (vid) and status for specific ports

Switch# show vlan ports A1-A2
Status and Counters - VLAN Information - for ports A1,A2

<table>
<thead>
<tr>
<th>802.1Q VLAN ID</th>
<th>Name</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>33</td>
<td>VLAN-33</td>
<td>Static</td>
</tr>
</tbody>
</table>

Because ports A1 and A2 are not members of VLAN-44, it does not appear in this listing.

Figure 52: Example of VLAN listing for the entire switch

Switch# show vlan
Status and Counters - VLAN Information

VLAN support : Yes
Maximum VLANs to support : 9
Primary VLAN: DEFAULT_VLAN

<table>

</table>

Configuring local mirroring

To configure a local mirroring session in which the mirroring source and destination are on the same switch, follow these general steps:

Procedure

1. Determine the session and local destination port:
a. Session number (1) and (optional) alphanumeric name

b. Exit port (any port on the switch except a monitored interface used to mirror traffic)

**IMPORTANT:** Hewlett Packard Enterprise strongly discourages connecting a mirroring exit port to a network because doing so can result in serious network performance problems. Only connect an exit port to a network analyzer, IDS, or other network edge device that has no connection to other network resources.

2. Enter the `mirror-port` port number command to configure the session.

3. Determine the traffic to be selected for mirroring by any of the following methods and the appropriate configuration level (mesh and switch).

4. Enter the `monitor` command to assign one or more source interfaces to the session.

After you complete step 4, the switch begins mirroring traffic to the configured exit port.

The following commands configure mirroring for a local session in which the mirroring source and destination are on the same switch.

- The `mirror` command identifies the destination in a mirroring session.
- The `interface` and `vlan` commands identify the mirroring source, including source interface, traffic direction, and traffic-selection criteria for a specified session.

**NOTE:** With no `allow-v2-modules` specified in the configuration of a switch with V3 modules on KB firmware, Egress VLAN ACLs do not filter mirrored traffic. You must use a port ACL to filter mirrored traffic.

### Local mirroring sessions

**Syntax**

```
[no] mirror-port <EXIT-PORT-#>
```

**Description**

Configure local mirroring sessions.

**Parameters and options**

`mirror-port <EXIT-PORT-#>`

When used with `mirror-port <EXIT-PORT-#>` command, removes the mirroring session and any mirroring source previously assigned to that session by the following commands.

### Traffic-direction criteria

**interface monitor all**

**Syntax**

```
[no] [interface <PORT> |<TRUNK>] monitor
```

### Mirror policy for inbound traffic
class [ipv4|ipv6]

Syntax

class [ipv4|ipv6] <CLASSNAME> [no] [seq-number] [match|ignore] <IP-PROTOCOL> <SOURCE-ADDRESS> <DESTINATION-ADDRESS> [precedence <PRECEDENCE-VALUE>] [tos <TOS-VALUE>] [ip-dscp <CODEPOINTS>] [vlan <VLAN-ID>]

Description

Configures the mirroring policy for inbound traffic on the switch.

Parameters and options

policy mirror

Syntax

policy mirror <POLICY-NAME> [no] <SEQ-NUMBER> [class [ipv4|ipv6] <CLASSNAME> action mirror <SESSION>] [action mirror <SESSION>] [no] default-class action mirror <SESSION> [no] [interface <PORT/TRUNK>| vlan <VID-#>] service-policy <MIRROR-POLICY-NAME> in

Description

The [no] [interface <PORT/TRUNK>| vlan <VID-#>] service-policy <MIRROR-POLICY-NAME> in command removes the mirroring policy from a port, VLAN, trunk, or mesh interface for a specified session, but leaves the session available for other assignments.

Parameters and options

mirror <SESSION>

Accepts either a number (1 to 4) or a name. To use a name, you must first configure the name <NAME-STR> parameter option for the specified mirroring session using the policy mirror command.

MAC-based criteria to select traffic

monitor mac

Syntax

[no] monitor mac <MAC-ADDR> [src|dst|both] mirror session

Description

Configures traffic using MAC-based criteria.

Parameters and options

no

Use the no form of the complete Command syntax (for example, no monitor mac 112233-445566 src mirror 3) to remove a MAC address as mirroring criteria from an active session on the switch without removing the session itself.

mirror

Enter the monitor mac mirror command at the global configuration level.
Remote mirroring destination on a remote switch

Syntax
mirror endpoint ip <SRC-IP> <SRC-UDP-PORT> <DST-IP> <EXIT-PORT> [truncation]

Description
Configures a remote mirroring destination on a remote switch.

Parameters and options

Remote mirroring destination on a local switch

mirror remote ip

Syntax
mirror <SESSION> remote ip <SRC-IP> <SRC-UDP-PORT> <DST-IP>

Description
Configures a remote mirroring destination on a local switch.

Parameters and options

Local mirroring destination on the local switch

mirror port

Syntax
mirror <SESSION> port <EXIT-PORT>

Description
Configures a local mirroring destination on a local switch.

Parameters and options

Monitored traffic

interface

Syntax
interface <PORT/TRUNK/MESH>

Description

Parameters and options

monitor all

Syntax
monitor all [in|out|both] mirror <SESSION> [no-tag-added]
mirror ip access-group ACL-NAME in mirror <SESSION>
mirror mac <MAC-ADDR> [src|dest|both] mirror
show monitor [endpoint|SESSION-NUMBER|name SESSION-NAME]

**service-policy**

Syntax

```
service-policy <mirror-policy-name> in
```

**Destination mirror on a remote switch**

**mirror endpoint**

Syntax

```
mirror endpoint ip <SRC-IP-ADDR> <SRC-UDP-PORT> <DST-IP-ADDR> port <EXIT-PORT>
```

**Description**

Enter this command on a remote switch to configure the exit port to use in a remote mirroring session. to configure the mirroring source on the local switch.

The `mirror endpoint ip` command configures:

- The unique UDP port number to be used for the mirroring session on the source switch. The recommended port range is from 7933 to 65535.
- The IP address of the source switch to use in the session.
- The IP address and exit-port number on the remote (endpoint) switch.

In a remote mirroring endpoint, the IP address of exit port and the remote destination switch can belong to different VLANs.

**Source mirror on the local switch**

**mirror remote ip**

Syntax

```
[no] mirror 1 - 4 [name <NAME-STR>] remote ip <SRC-IP> <SRC-UDP-PORT> <DST-IP> [truncation]
```

**Description**

Configures the mirroring source on the local switch.

**Parameters and options**

`no mirror 1-4`

Removes both the mirroring session and any mirroring sources previously assigned to the session by the following commands.

**Traffic-direction criteria**

Syntax

```
[no] [interface <PORT> <TRUNK>|vlan VID-#] monitor all in|out|both mirror 1-4|<NAME-STR> [1 - 4]<NAME-STR . ..]
```

**Description**
Configures traffic direction criteria for specific traffic

**Configure ACL criteria to select inbound**

**interface monitor ip access-group**

**Syntax**

```plaintext
[no] [interface <PORT> <TRUNK> | vlan <VID-#>] monitor ip access-group <ACL-NAME> in mirror [1-4|<NAME-STR>] [1 - 4|<NAME-STR> . . .]
```

**Configuring a destination switch in a remote mirroring session**

**CAUTION:** When configuring a remote mirroring session, **always** configure the destination switch first. Configuring the source switch first can result in a large volume of mirrored, IPv4-encapsulated traffic arriving at the destination without an exit path, which can slow switch performance.

**Syntax**

```plaintext
mirror endpoint ip src-ip src-udp-port dst-ip exit-port-# no mirror endpoint ip src-ip src-udp-port dst-ip
```

Used on a destination switch to configure the remote endpoint of a mirroring session. The command uniquely associates the mirrored traffic from the desired session on a monitored source with a remote exit port on the destination switch. You must use the same set of source and destination parameters used when you configure the same session on both the source and destination switches.

For a given mirroring session, the same `src-ip`, `src-udp-port` and `dst-ip` values must be entered with the `mirror endpoint ip` command on the destination switch, and later with the `mirror remote ip` command on the source switch.

**CAUTION:** Do not remove the configuration of a remote mirroring endpoint support for a given session if there are source switches currently configured to mirror traffic to the endpoint.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>src-ip</code></td>
<td>Must exactly match the <code>src-ip</code> address you configure on the source switch for the remote session.</td>
</tr>
<tr>
<td><code>src-udp-port</code></td>
<td>Must exactly match the <code>src-udp-port</code> value you configure on the source switch for the remote session. The recommended port range is 7933 to 65535. This setting associates the monitored source with the desired remote endpoint in the remote session by using the same, unique UDP port number to identify the session on the source and remote switches.</td>
</tr>
<tr>
<td><code>dst-ip</code></td>
<td>Must exactly match the <code>dst-ip</code> setting you configure on the source switch for the remote session.</td>
</tr>
<tr>
<td><code>exit-port-#</code></td>
<td>Exit port for mirrored traffic in the remote session, to which a traffic analyzer or IDS is connected.</td>
</tr>
</tbody>
</table>

The `no` form of the command deletes the mirroring endpoint for the configured session on the remote destination switch.
Configuring a source switch in a local mirroring session

Enter the `mirror port` command on the source switch to configure an exit port on the same switch. To create the mirroring session, use the information gathered in **High-level overview of the mirror configuration process** on page 416.

**Syntax**

```
mirror l port exit-port-# [name name-str] no mirror l
```

Assigns the exit port to use for the specified mirroring session and must be executed from the global configuration level.

<table>
<thead>
<tr>
<th>1</th>
<th>Identifies the mirroring session created by this command. (Multiple sessions on the switch can use the same exit port.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>name name-str</td>
<td>Optional alphanumeric name string used to identify the session (up to 15 characters)</td>
</tr>
<tr>
<td>port exit-port-#</td>
<td>Exit port for mirrored traffic in the remote session. This is the port to which a traffic analyzer or IDS is connected.</td>
</tr>
</tbody>
</table>

The `no` form of the command removes the mirroring session and any mirroring source previously assigned to that session.

Configuring a source switch in a remote mirroring session

**Syntax**

```
[no] mirror 1 - 4 [name name-str] remote ip src-ip src-udp-port dst-ip [truncation]
```

Used on the source switch to uniquely associate the mirrored traffic in the specified session with a remote destination switch. You must configure the same source and destination parameters when you configure the same session on both the source and destination switches. (If multiple remote sessions use the same source and destination IP addresses, each session must use a unique UDP port value.)

When you execute this command, the following message is displayed:

**Caution:** Please configure destination switch first.

Do you want to continue [y/n]?

- If you have not yet configured the session on the remote destination switch, follow the configuration procedure in **Configure a mirroring destination on a remote switch** on page 417 before using this command.
- If you have already configured the session on the remote destination switch, enter `y` (for "yes") to complete this command.

<table>
<thead>
<tr>
<th>1 - 4</th>
<th>Identifies the mirroring session created by this command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>name name-str</td>
<td>Optional alphanumeric name string used as an additional session identifier (up to 15 characters.)</td>
</tr>
<tr>
<td>src-ip</td>
<td>The IP address of the VLAN or subnet on which the traffic to be mirrored enters or leaves the switch.</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>src-udp-port</td>
<td>Associates the remote session with a UDP port number. When multiple sessions have the same source IP address src-ip and destination IP address dst-ip, the UDP port number must be unique in each session. The UDP port number used for a given session should be in the range of 7933 to 65535.</td>
</tr>
<tr>
<td></td>
<td>CAUTION: UDP port numbers below 7933 are reserved for various IP applications. Using them for mirroring can result in the interruption of other IP functions and in non-mirrored traffic being received on the destination switch and sent to a device connected to the remote exit port.</td>
</tr>
<tr>
<td>dst-ip</td>
<td>For the remote session specified in the command, this is the IP address of the VLAN or subnet on which the remote exit port exists. (The exit port to which a traffic analyzer or IDS is connected is configured on the remote switch in section.)</td>
</tr>
<tr>
<td>[truncation]</td>
<td>Enables truncation of oversize frames, causing the part of the frame in excess of the MTU size to be truncated. Unless truncation is enabled, oversize frames are dropped. The frame size is truncated to a multiple of 18 bytes—for example, if the MTU is 1000 bytes, the frame is truncated to 990 bytes (55 * 18 bytes.)</td>
</tr>
</tbody>
</table>

The no form of the command removes the mirroring session and any mirroring source previously assigned to the session. To preserve the session while deleting a monitored source assigned to it.

**Selecting all traffic on a port interface for mirroring according to traffic direction**

**Syntax**

```
[no] interface port/trunk/mesh monitor [in | out | both] [mirror 1 | name-str] [{1 | name-str} | {1 | name-str} | {1 | name-str}] [no-tag-added]
```

Assigns a mirroring source to a previously configured mirroring session on a source switch by specifying the port, trunk, and/or mesh sources to use, the direction of traffic to mirror, and the session.
<table>
<thead>
<tr>
<th><strong>interface port/trunk/mesh</strong></th>
<th>Identifies the source ports, static trunks, and/or mesh on which to mirror traffic. Use a hyphen for a range of consecutive ports or trunks (a5-a8, Trk2-Trk4.) Use a comma to separate non-contiguous interfaces (b11,b14,Trk4, Trk7.)</th>
</tr>
</thead>
</table>
| **monitor all [in | out | both]** | For the interface specified by *port/trunk/mesh*, selects traffic to mirror based on whether the traffic is entering or leaving the switch on the interface:  
- **in**: Mirrors entering traffic.  
- **out**: Mirrors exiting traffic.  
- **both**: Mirrors traffic entering and exiting.  
If you enter the *monitor all* command without selection criteria or a session identifier, the command applies by default to session 1 |
| **mirror [1 | name-str]** | Assigns the traffic specified by the interface and direction to a session by number or—if configured—by name. The session must have been previously configured.  
Depending on how many sessions are already configured on the switch, you can use the same command to assign the specified source to up to four sessions, for example, *interface a1 monitor all in mirror 1*  
- **1**: Configures the port traffic to be mirrored in the specified session number.  
- *[ name name-str]*: Optional; configures the port traffic to be mirrored in the specified session name. The string can be used interchangeably with the session number when using this command to assign a mirroring source to a session. |
| **[no-tag-added]** | Prevents a VLAN tag from being added to the mirrored copy of an outbound packet sent to a local or remote mirroring destination. |

The *no* form of the command removes a mirroring source assigned to the session, but does not remove the session itself. This enables you to repurpose a session by removing an unwanted mirroring source and adding another in its place.

**Selecting all traffic on a VLAN interface for mirroring according to traffic direction**

**Syntax**

```
vlan vid-# monitor all [in | out | both] [mirror 1 - 4 | name-str] [(1 - 4 | name-str) | (1 - 4 | name-str) | (1 - 4 | name-str) |
```

This command assigns a monitored VLAN source to a previously configured mirroring session on a source switch by specifying the VLAN ID, the direction of traffic to mirror, and the session.
vlan vid-#  
Identifies the VLAN on which to mirror traffic.

monitor all [in | out | both]  
Uses the direction of traffic on the specified vid-# to select traffic to mirror. If you enter the monitor all command without selection criteria or a session identifier, the command applies by default to session 1.

mirror [1 - 4 | name-str]  
Assigns the VLAN traffic defined by the VLAN ID and traffic direction to a session number or name. Depending on how many sessions are already configured on the switch, you can use the same command to assign the specified VLAN source to up to four sessions, for example, interface a1 monitor all in mirror 1 2 4.

- 1 - 4: Configures the selected VLAN traffic to be mirrored in the specified session number.
- [name name-str]: Optional; configures the selected port traffic to be mirrored in the specified session name. The string can be used interchangeably with the session number when using this command to assign a mirroring source to a session. To configure an alphanumeric name for a mirroring session, see the command description under Configuring a source switch in a remote mirroring session on page 397.

Assigning a VLAN to a mirroring session precludes assigning any other mirroring sources to the same session. If a VLAN is already assigned to a given mirroring session, using this command to assign another VLAN to the same mirroring session results in the second assignment replacing the first. Also, if there are other (port, trunk, or mesh) mirroring sources already assigned to a session, the switch displays a message similar to:

Mirror source port exists on session N. Can not add mirror source VLAN.

The no form of the command removes a mirroring source assigned to the session, but does not remove the session itself. This allows you to repurpose a session by removing an unwanted mirroring source and adding another in its place.

Configuring a MAC address to filter mirrored traffic on an interface

Enter the monitor mac mirror command at the global configuration level.

Syntax

[no] monitor mac mac-addr [src | dest | both] [mirror 1 - 4 | name-str] [1 - 4 | name-str] [1 - 4 | name-str] [1 - 4 | name-str]

Use this command to configure a source and/or destination MAC address as criteria for selecting traffic in one or more mirroring sessions on the switch. The MAC address you enter is configured to mirror inbound (src), outbound (dest), or both inbound and outbound (both) traffic on any port or learned VLAN on the switch.
monitor mac mac-addr

Configures the MAC address as selection criteria for mirroring traffic on any port or learned VLAN on the switch.

{src | dest | both}

Specifies how the MAC address is used to filter and mirror packets in inbound and/or outbound traffic on the interfaces on which the mirroring session is applied:

- src: Mirrors all packets in inbound traffic that contain the specified MAC address as source address.
- dest: Mirrors all packets in outbound traffic that contain the specified MAC address as destination address.

NOTE: The MAC address of the switch is not supported as either the source or destination MAC address used to select mirrored traffic.

both: Mirrors all packets in both inbound and outbound traffic that contain the specified MAC address as either source or destination address.

mirror [1 - 4 | name-str]

Assigns the inbound and/or outbound traffic filtered by the specified MAC address to a previously configured mirroring session. The session is identified by a number or (if configured) a name.

Depending on how many sessions are configured on the switch, you can use the same command to configure a MAC address as mirroring criteria in up to four sessions. To identify a session, you can enter either its name or number; for example: mirror 1 2 3 traffsrc4

1 - 4: Specifies a mirroring session by number, for which the configured MAC address is used to select and mirror inbound and/or outbound traffic.

Packets that are sent or received on an interface configured with a mirroring session and that contain the MAC address as source and/or destination address are mirrored to a previously configured destination device.

To remove a MAC address as selection criteria in a mirroring session, you must enter the complete Command syntax, for example, no monitor mac 998877-665544 dest mirror 4.

The no form of the command removes the MAC address as a mirroring criteria from an active session, but does not remove the session itself. This enables you to repurpose a session by removing an unwanted mirroring criteria and adding another in its place.

**Configuring classifier-based mirroring**

For more information and a list of general steps for the process beginning with this command, see the information about restrictions on classifier-based mirroring.

**Context: Global configuration**

**Syntax**

[no] class [ipv4 | ipv6 classname]

Defines the name of a traffic class and specifies whether a policy is to be applied to IPv4 or IPv6 packets, where classname is a text string (64 characters maximum.)
After you enter the `class` command, you enter the class configuration context to specify match criteria. A traffic class contains a series of `match` and `ignore` commands, which specify the criteria used to classify packets.

To configure a default traffic class, use the `default-class` command as described below. A default class manages the packets that do not match the match/ignore criteria in any other classes in a policy.

**Context: Class configuration**

**Syntax**

```
[no] seq-number
  [match | ignore ip-protocol source-address destination-address] [ip-dscp
codepoint] [precedence precedence-value] [tos tos-value] [vlan vlan-id]
```

For detailed information about how to enter `match` and `ignore` commands to configure a traffic class, see the *Advanced Traffic Management Guide*.

**Context: Global configuration**

**Syntax**

```
[no] policy mirror policy-name
```

Defines the name of a mirroring policy and enters the policy configuration context.

A traffic policy consists of one or more classes and one or more mirroring actions configured for each class of traffic. The configured actions are executed on packets that match a `match` statement in a class. No policy action is performed on packets that match an `ignore` statement.

**Context: Policy configuration**

**Syntax**

```
[no] seq-number
  class [ipv4 | ipv6 class-name] action mirror session
```

Defines the mirroring action to be applied on a pre-configured IPv4 or IPv6 traffic class when a packet matches the `match` criteria in the traffic class. You can enter multiple `class action mirror session` statements in a policy.

```
[seq-number]
  The (optional) seq-number parameter sequentially orders the mirroring actions that you enter in a policy configuration. Actions are executed on matching packets in numerical order.

  Default: Mirroring action statements are numbered in increments of 10, starting at 10.

class [ipv4 | ipv6 class-name]
  Defines the preconfigured traffic class on which the mirroring actions in the policy are executed and specifies whether the mirroring policy is applied to IPv4 or IPv6 traffic in the class. The class-name is a text string (64 characters maximum.)

action mirror session
  Configures mirroring for the destination and session specified by the session parameter.
```
Context: Policy configuration
Syntax

[no] default-class action mirror session [action mirror session ...]

Configures a default class that allows packets that are not matched nor ignored by any of the class configurations in a mirroring policy to be mirrored to the destination configured for the specified session.

Applying a mirroring policy on a port or VLAN interface

Enter one of the following service-policy commands from the global configuration context.

Context: Global configuration
Syntax

interface <PORT-LIST> service-policy policy-name in

Configures the specified ports with a mirroring policy that is applied to inbound traffic on each interface.

Separate individual port numbers in a series with a comma, for example, a1,b4,d3. Enter a range of ports by using a dash, for example, a1-a5.

The mirroring policy name you enter must be the same as the policy name you configured with the policy mirror command.

Syntax

vlan vlan-id service-policy policy-name in

Configures a mirroring policy on the specified VLAN that is applied to inbound traffic on the VLAN interface.

Valid VLAN ID numbers range from 1 to 4094.

The mirroring policy name you enter must be the same as the policy name you configured with the policy mirror command in the syntax policy mirror.

Viewing a classifier-based mirroring configuration

To display information about a classifier-based mirroring configuration or statistics on one or more mirroring policies, enter one of the following commands:

Syntax

show class [ipv4 class-name | ipv6 class-name | config]

Syntax

show policy [policy-name | config]

Syntax

show policy resources

Syntax

show statistics policy [policy-name] [interface port-num | vlan vid in]
Viewing all mirroring session configured on the switch

Syntax

show monitor

If a monitored source for a mirror session is configured on the switch, the following information is displayed. Otherwise, the output displays: Mirroring is currently disabled. Mirror port configured on the switch is shown:

```
switch(config) # show monitor
Network Monitoring Port
Mirror Port: 16
Monitoring sources
---------------
  2
  5
```

Viewing the remote endpoints configured on the switch

Syntax

show monitor endpoint

Displays the remote mirroring endpoints configured on the switch. Information on local sessions configured on the switch is not displayed. (To view the configuration of a local session, use the show monitor [1-4 | name <name-str>] command)

<table>
<thead>
<tr>
<th>Type</th>
<th>Indicates whether the session is a port (local) or IPv4 (remote) mirroring session.</th>
</tr>
</thead>
<tbody>
<tr>
<td>show monitor</td>
<td>The IP address configured for the source VLAN or subnet on which the monitored source</td>
</tr>
<tr>
<td>endpoint</td>
<td>interface exists. In the configuration of a remote session, the same UDP source address</td>
</tr>
<tr>
<td></td>
<td>must be configured on the source and destination switches.</td>
</tr>
<tr>
<td>UDP port</td>
<td>The unique UDP port number that identifies a remote session. In the configuration of a</td>
</tr>
<tr>
<td></td>
<td>remote session, the same UDP port number must be configured on the source and</td>
</tr>
<tr>
<td></td>
<td>destination switches.</td>
</tr>
<tr>
<td>UDP Dest Addr</td>
<td>The IP address configured for the destination VLAN or subnet on which the remote exit</td>
</tr>
<tr>
<td></td>
<td>port exists. In the configuration of a remote session, the same UDP destination address</td>
</tr>
<tr>
<td>Dest Port</td>
<td>specifies the exit port for a remote session on a remote destination switch.</td>
</tr>
</tbody>
</table>

Example
In the following figure, the show monitor endpoint output shows that the switch is configured as the remote endpoint (destination) for two remote sessions from the same monitored source interface.

Figure 54: Displaying the configuration of remote mirroring endpoints on the switch

<table>
<thead>
<tr>
<th>Switch(config)# show monitor endpoint</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Mirroring - Remote Endpoints</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>IPv4</td>
</tr>
<tr>
<td>IPv4</td>
</tr>
</tbody>
</table>

These two sessions monitor traffic from the same source switch, but use different UDP port numbers.

Viewing the mirroring configuration for a specific session

Syntax

```plaintext
show monitor [1 | name name-str]
```

Displays detailed configuration information for a specified local or remote mirroring session on a source switch.

<table>
<thead>
<tr>
<th>Session</th>
<th>Displays the session.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session Name</td>
<td>Displays the name of the session, if configured.</td>
</tr>
<tr>
<td>Policy</td>
<td>Indicates whether the source is using a classifier-based mirroring policy to select inbound IPv4 or IPv6 traffic for mirroring.</td>
</tr>
<tr>
<td>Mirroring Destination</td>
<td>For a local mirroring session, displays the port configured as the exit port on the source switch. For a remote mirroring session, displays IPv4, which indicates mirroring to a remote (endpoint) switch.</td>
</tr>
<tr>
<td>UDP Source Addr</td>
<td>The IP address configured for the source VLAN or subnet on which the monitored source interface exists. In the configuration of a remote session, the same UDP source address must be configured on the source and destination switches.</td>
</tr>
<tr>
<td>UDP port</td>
<td>The unique UDP port number that identifies a remote session. In the configuration of a remote session, the same UDP port number must be configured on the source and destination switches.</td>
</tr>
<tr>
<td>UDP Dest Addr</td>
<td>The IP address configured for the destination VLAN or subnet on which the remote exit port exists. In the configuration of a remote session, the same UDP destination address must be configured on the source and destination switches.</td>
</tr>
<tr>
<td>Status</td>
<td>For a remote session, displays current session activity:</td>
</tr>
<tr>
<td></td>
<td>• active: The session is configured and is mirroring traffic. A remote path has been discovered to the destination.</td>
</tr>
<tr>
<td></td>
<td>• inactive: The session is configured, but is not currently mirroring traffic. A remote path has not been discovered to the destination.</td>
</tr>
<tr>
<td></td>
<td>• not defined: Mirroring is not configured for this session.</td>
</tr>
</tbody>
</table>

Table Continued
Monitoring Sources  For the specified local or remote session, displays the source (port, trunk, or VLAN) interface and the MAC address (if configured) used to select mirrored traffic.

Direction  For the selected interface, indicates whether mirrored traffic is entering the switch (in), leaving the switch (out), or both.

**Viewing a remote mirroring session**

After you configure session 2 for remote mirroring ([Figure 55: Configuring a remote mirroring session and monitored source on page 406](#)), you can enter the `show monitor 2` command to verify the configuration ([Figure 56: Displaying the Configuration of a Remote Mirroring Session on page 406](#)).

**Figure 55: Configuring a remote mirroring session and monitored source**

```
Switch(config)# mirror 2 name test-10 remote ip 10.10.10.1 8010 10.10.30.2
Caution: Please configure destination switch first.
Do you want to continue [y/n]? y
HP Switch(config)# interface bl monitor all both mirror 2
```

**Figure 56: Displaying the Configuration of a Remote Mirroring Session**

```
Switch(config)# show monitor 2
Network Monitoring
   Session: 2   Session Name: test-10
   Policy: no policy relationship exists
   Mirror Destination:  IPv4
      UDP Source Addr  UDP port  UDP Dest Addr  Status
           10.10.10.1     8010     10.10.30.2    active
   Monitoring Sources  Direction
   Port: Bl   Both
```

If no monitored (source) interface is configured for a mirroring session, no information is displayed in the Monitoring Sources and Direction columns.
Viewing a MAC-based mirroring session

After you configure a MAC-based mirroring session (Figure 57: Configuring a MAC-based mirroring session on page 407), you can enter the `show monitor 3` command to verify the configuration (Figure 58: Displaying a MAC-based mirroring session on page 407.)

Figure 57: Configuring a MAC-based mirroring session

```
Switch(config)# mirror 3 port a1
Switch# monitor mac 112233-445566 src mirror 3
```

Figure 58: Displaying a MAC-based mirroring session

```
Switch(config)# show monitor 3
Network Monitoring
    Session: 3   Session Name: 
    Policy: no policy relationship exists
    Mirror Destination: a1   (Port)
    Monitoring Sources   Direction
    ----------------------  ---------
    MAC: 112233-445566   Source
```

Viewing a local mirroring session

When used to display the configuration of a local session, the `show monitor` command displays a subset of the information displayed for a remote mirroring session.

Example

Figure 59: Displaying the configuration of a local mirroring session on page 407 displays a local mirroring configuration for a session configured as follows:

- Session number: 1
- Session name: Detail
- Classifier-based mirroring policy, "MirrorAdminTraffic", is used to select inbound traffic on port B1.
- Mirrored traffic is sent to exit port B3.

Figure 59: Displaying the configuration of a local mirroring session

```
Switch(config)# show monitor 1
Network Monitoring
    Session: 1   Session Name: Detail
    Policy: MirrorAdminTraffic
    Mirror Destination: B3   (Port)
    Monitoring Sources   Direction
    ----------------------  ---------
    Port: B1   In
```
Viewing information on a classifier-based mirroring session

In the following example, a classifier-based mirroring policy (mirrorAdminTraffic) mirrors selected inbound IPv4 packets on VLAN 5 to the destination device configured for mirroring session 3.

**Figure 60: Configuring a classifier-based mirroring policy in a local mirroring session**

```
Switch(config)# mirror 3 port cl
Caution: Please configure destination switch first.
Do you want to continue [y/n]? y
HP Switch(config)# class ipv4 AdminTraffic
HP Switch(config-class)# match ip 15.29.61.1 0.63.255.255 0.0.0.0 255.255.255.255
HP Switch(config-class)# match ip 0.0.0.0 255.255.255.255 15.29.61.1 0.63.255.255
HP Switch(config-class)# exit
HP Switch(config)# policy mirror MirrorAdminTraffic
HP Switch(config-policy)# class ipv4 AdminTraffic action mirror 3
HP Switch(config-policy)# exit
HP Switch(config)# vlan 5 service-policy MirrorAdminTraffic in
```

Displaying a classifier-based policy in a local mirroring session

```
switch(config)# show monitor 3

Network Monitoring

  Session: 3   Session Name: 
  Policy: MirrorAdminTraffic

  Mirror Destination:  C1   (Port)

  Monitoring Sources Direction
  ------------------  ---------
  VLAN: 5             Source
```

Viewing information about a classifier-based mirroring configuration

**Syntax**

```
show class ipv4 classname
show class ipv6 classname
show class config
```

- `ipv4 classname` Lists the statements that make up the IPv4 class identified by `classname`
- `ipv6 classname` Lists the statements that make up the IPv6 class identified by `classname`
- `config` Displays all classes, both IPv4 and IPv6, and lists the statements that make up each class.
Additional variants of the `show class ...` command provide information on classes that are members of policies that have been applied to ports or VLANs.

**Figure 61: show class output for a mirroring policy**

```
Switch(config)# show class ipv4 AdminTraffic
Statements for Class ipv4 "AdminTraffic"
  10 match ip 15.29.16.1 0.63.255.255 0.0.0.0 255.255.255.255
  20 match ip 0.0.0.0 255.255.255.255 15.29.16.1 0.63.255.255
```

**Viewing information about a classifier-based mirroring configuration**

**Syntax**

```
show policy policy-name
show policy config
```

- `policy-name` \(\text{Lists the statements that make up the specified policy.}\)
- `config` \(\text{Displays the names of all policies defined for the switch and lists the statements that make up each policy.}\)

Additional variants of the `show policy` command provide information on policies that have been applied to ports or VLANs.

**Figure 62: show policy output for a mirroring policy**

```
Switch(config)# show policy MirrorAdminTraffic
Statements for Policy "MirrorAdminTraffic"
  10 class ipv4 "AdminTraffic" action mirror 3
```

**Viewing resource usage for mirroring policies**

**Syntax**

```
show policy resources
```

Displays the number of hardware resources (rules, meters, and application port ranges) used by classifier-based mirroring policies (local and remote) that are currently applied to interfaces on the switch, as well as QoS policies and other software features.
NOTE: The information displayed is the same as the output of the `show qos resources` and `show access-list resources` commands.

Figure 63: Displaying the hardware resources used by currently configured mirroring policies

```
<table>
<thead>
<tr>
<th>Switch# show policy resources</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource usage in Policy Enforcement Engine</td>
</tr>
<tr>
<td>Ports</td>
</tr>
<tr>
<td>1-24</td>
</tr>
<tr>
<td>25-48</td>
</tr>
<tr>
<td>A</td>
</tr>
</tbody>
</table>

| Meters | Meters Used |
|------------------------|
| Ports | Available | ACL | QoS | IDM | VT | Mirror | Other | ------------------------ |
| 1-24 | 250 | 5 | 0 | | | | 0 | | --------------- |
| 25-48 | 251 | 4 | 0 | | | | 0 | | --------------- |
| A | 253 | 2 | 0 | | | | 0 | | --------------- |

| Application | Port Ranges | Application Port Ranges Used |
|------------------------|
| Ports | Available | ACL | QoS | IDM | VT | Mirror | Other | ------------------------ |
| 1-24 | 3014 | 2 | 0 | 0 | | | 0 | | --------------- |
| 25-48 | 3005 | 2 | 0 | 0 | | | 0 | | --------------- |
| A | 3017 | 2 | 0 | 0 | | | 0 | | --------------- |

0 of 8 Policy Engine management resources used.

Key:
ACL = Access Control Lists
QoS = Device & Application Port Priority, QoS Policies, ICMP rate limits
IDM = Identity Driven Management
VT = Virus Throttling blocks
Mirror = Mirror Policies, Remote Intelligent Mirror endpoints
Other = Management VLAN, DHCP Snooping, ARP Protection, Jumbo IP-MTU.

Resource usage includes resources actually in use, or reserved for future use by the listed feature. Internal dedicated-purpose resources, such as port bandwidth limits or VLAN QoS priority, are not included.

Viewing the mirroring configurations in the running configuration file

Use the `show run` command to view the current mirroring configurations on the switch. In the `show run` command output, information about mirroring sources in configured sessions begins with the `mirror` keyword; monitored source interfaces are listed per-interface.

Compatibility mode

The following table shows how the v2 zl and zl modules behave in various combinations and situations when Compatibility mode is enabled and when it is disabled.
Table 26: Compatibility mode enabled/disabled comparisons

<table>
<thead>
<tr>
<th>Modules</th>
<th>Compatibility mode enabled</th>
<th>Compatibility mode disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>v2 zl modules only</td>
<td>Can insert zl module and the module will come up. Any v2 zl modules are limited to the zl configuration capacities.</td>
<td>v2 zl modules are at full capacity. Zl modules are not allowed to power up.</td>
</tr>
<tr>
<td>Mixed v2 zl and zl modules</td>
<td>Can insert zl module and the module will come up. Any v2 zl modules are limited to the zl configuration capacities. If compatibility mode is disabled, the zl modules go down.</td>
<td>ZL modules are not allowed to power up.</td>
</tr>
<tr>
<td>Zl modules only</td>
<td>Same as exists already. If a v2 zl module is inserted, it operates in the same mode as the zl module, but with performance increases.</td>
<td>The Management Module is the only module that powers up.</td>
</tr>
<tr>
<td></td>
<td>In Compatibility Mode, no v2 zl features are allowed, whether the modules are all v2 zl or not.</td>
<td>If Compatibility Mode is disabled and then enabled, the startup config is erased and the chassis reboots.</td>
</tr>
</tbody>
</table>

Traffic mirroring overview

Traffic mirroring (Intelligent Mirroring) allows you to mirror (send a copy of) network traffic received or transmitted on a switch interface to a local or remote destination, such as a traffic analyzer or IDS.)

Traffic mirroring provides the following benefits:

- Allows you to monitor the traffic flow on specific source interfaces.
- Helps in analyzing and debugging problems in network operation resulting from a misbehaving network or an individual client. The mirroring of selected traffic to an external device makes it easier to diagnose a network problem from a centralized location in a topology spread across a campus.

Mirroring overview

Figure 64: Local and remote sessions showing mirroring terms on page 412 shows an example of the terms used to describe the configuration of a sample local and remote mirroring session:

- In the local session, inbound traffic entering Switch A is monitored on port A2 and mirrored to a destination (host), traffic analyzer 1, through exit port A15 on the switch. A local mirroring session means that the monitored interface (A2) and exit port (A15) are on the same switch.
- In the remote session, inbound traffic entering Switch A is monitored on port A1. A mirrored copy of monitored traffic is routed through the network to a remote mirroring endpoint: exit port B7 on Switch B. A destination device, traffic analyzer 2, is connected to the remote exit port. A remote mirroring session means that:
- The monitored interface (A1) and exit port (B7) are on different switches.
- Mirrored traffic can be bridged or routed from a source switch to a remote switch.

**Figure 64: Local and remote sessions showing mirroring terms**

![Diagram showing mirroring terms](image)

**Mirroring destinations**

Traffic mirroring supports destination devices that are connected to the local switch or to a remote switch:

Traffic can be copied to a destination (host) device connected to the same switch as the mirroring source in a local mirroring session. You can configure up to four exit ports to which destination devices are connected.

**Mirroring sources and sessions**

Traffic mirroring supports the configuration of port in up to four mirroring sessions on a switch. Each session can have one or more sources (ports and/or static trunks) that monitor traffic entering and/or leaving the switch.

**NOTE:** Using the CLI, you can make full use of the switch’s local and remote mirroring capabilities.

**Mirroring sessions**

A mirroring session consists of a mirroring source and destination (endpoint.) Although a mirroring source can be one of several interfaces, as mentioned above, for any session, the destination must be a single (exit) port. The exit port cannot be a trunk.

You can map multiple mirroring sessions to the same exit port, which provides flexibility in distributing hosts, such as traffic analyzers or an IDS. In a remote mirroring endpoint, the IP address of the exit port and the remote destination switch.
Mirroring sessions can have the same or a different destination. You can configure an exit port on the local (source) switch and/or on a remote switch as the destination in a mirroring session. When configuring a mirroring destination, consider the following options:

You can segregate traffic by type, direction, or source.

**Mirroring session limits**

A switch running software release K.12.xx or greater supports the following:

A maximum of one mirroring (local and remote) sessions.

**Selecting mirrored traffic**

You can use any of the following options to select the traffic to be mirrored on a port, trunk, mesh, or VLAN interface in a local or remote session:

- **All traffic**
  Monitors all traffic entering or leaving the switch on one or more interfaces (inbound and outbound.)

- **Direction-based traffic selection**
  Monitors traffic that is either entering or leaving the switch (inbound or outbound.) Monitoring traffic in only one direction improves operation by reducing the amount of traffic sent to a mirroring destination.

- **MAC-based traffic selection**
  Monitors only traffic with a matching source and/or destination MAC address in packet headers entering and/or leaving the switch on one or more interfaces (inbound and/or outbound.)

- **Classifier-based service policy**
  Provides a finer granularity of match criteria to zoom in on a subset of a monitored port or VLAN traffic (IPv4 or IPv6) and select it for local or remote mirroring (inbound only.)

**Deprecation of ACL-based traffic selection**

The use of ACLs for selecting traffic in a mirroring session has been deprecated and is replaced by the use of advanced classifier-based service policies.

As with ACL criteria, classifier-based match/ignore criteria allow you to limit a mirroring session to selected inbound packets on a given port or VLAN interface (instead of mirroring all inbound traffic on the interface.)

The following commands have been deprecated:

- `interface port/trunk/mesh monitor ip access-group acl-name in mirror [1 - 4 | name-str]`
- `vlan vid-# monitor ip access-group acl-name in mirror [1 - 4 | name-str]`

After you install and boot release K.14.01 or greater, ACL-based local and remote mirroring sessions configured on a port or VLAN interface are automatically converted to classifier-based mirroring policies.

If you are running software release K.13.XX or earlier, ACL permit/deny criteria are supported to select IP traffic entering a switch to mirror in a local or remote session, using specified source and/or destination criteria.

**Mirrored traffic destinations**
Local destinations
A local mirroring traffic destination is a port on the same switch as the source of the traffic being mirrored.

Remote destinations
A remote mirroring traffic destination is an switch configured to operate as the exit switch for mirrored traffic sessions originating on other switches.

CAUTION: After you configure a mirroring session with traffic-selection criteria and a destination, the switch immediately starts to mirror traffic to each destination device connected to an exit port. In a remote mirroring session that uses IPv4 encapsulation, if the intended exit switch is not already configured as the destination for the session, its performance may be adversely affected by the stream of mirrored traffic. For this reason, Switch strongly recommends that you configure the exit switch for a remote mirroring session before configuring the source switch for the same session.

Monitored traffic sources
You can configure mirroring for traffic entering or leaving the switch on:

Ports and static trunks
Provides the flexibility for mirroring on individual ports, groups of ports, static port trunks, or any combination of these.

Criteria for selecting mirrored traffic
On the monitored sources listed above, you can configure the following criteria to select the traffic you want to mirror:

• Direction of traffic movement (entering or leaving the switch, or both.)
• Type of IPv4 or IPv6 traffic entering the switch, as defined by a classifier-based service policy.
• Source and/or destination MAC addresses in packet headers.

Mirroring configuration
The table below shows the different types of mirroring that you can configure using the CLI, Menu, and SNMP interfaces.

Table 27: Mirroring configuration options

<table>
<thead>
<tr>
<th>Monitoring interface and configuration level</th>

<td>All traffic</td>
<td>Not Applicable</td>
<td>Not Applicable</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

1 Configures only session 1, and only for local mirroring.

Configuration notes
Using the CLI, you can configure all mirroring options on a switch.
You can use the CLI can configure sessions 1 to 4 for local or remote mirroring in any combination, and override a Menu configuration of session 1.

You can also use SNMP configure sessions 1 to 4 for local or remote mirroring in any combination and override a Menu configuration of session 1, except that SNMP cannot be used to configure a classifier-based mirroring policy.

**Remote mirroring endpoint and intermediate devices**

The remote mirroring endpoint that is used in a remote mirroring session must be an switch that supports the mirroring functions described in this chapter. (A remote mirroring endpoint consists of the remote switch and exit port connected to a destination device.) Because remote mirroring on an switch uses IPv4 to encapsulate mirrored traffic sent to a remote endpoint switch, the intermediate switches and routers in a layer 2/3 domain can be from any vendor if they support IPv4.

The following restrictions apply to remote endpoint switches and intermediate devices in a network configured for traffic mirroring:

- The exit port for a mirroring destination must be an individual port and **not** a trunk, mesh, or VLAN interface.
- A switch mirrors traffic on static trunks, but not on dynamic LACP trunks.
- A switch mirrors traffic at line rate. When mirroring multiple interfaces in networks with high-traffic levels, it is possible to copy more traffic to a mirroring destination than the link supports. However, some mirrored traffic may not reach the destination. If you are mirroring a high-traffic volume, you can reduce the risk of oversubscribing a single exit port by:
  - Directing traffic from different session sources to multiple exit ports.
  - Configuring an exit port with a higher bandwidth than the monitored source port.

**Remote mirroring overview**

To configure a remote mirroring session in which the mirroring source and destination are on different switches, follow these general steps:

After you complete 5.b on page 416, the switch begins mirroring traffic to the remote destination (endpoint) configured for the session.

1. Determine the IP addressing, UDP port number, and destination (exit) port number for the remote session:
   - a. Source VLAN or subnet IP address on the source switch.
   - b. Destination VLAN or subnet IP address on the destination switch.
   - c. Random UDP port number for the session (7933-65535.)
   - d. Remote mirroring endpoint: Exit port and IP address of the remote destination switch (In a remote mirroring endpoint, the IP address of the exit port and remote switch can belong to different VLANs. Any loopback IP address can be used except the default loopback address 127.0.0.1.)

   Requirement: For remote mirroring, the same IP addressing and UDP port number must be configured on both the source and destination switches.

2. On the remote destination (endpoint) switch, enter the `mirror endpoint` command with the information from 1 on page 415 to configure a mirroring session for a specific exit port.

3. Determine the session (1 to 4) and (optional) alphanumeric name to use on the source switch.

4. Determine the traffic to be filtered by any of the following selection methods and the appropriate configuration level (VLAN, port, mesh, trunk, global):
Direction: inbound, outbound, or both.
Classifier-based mirroring policy: inbound only for IPv4 or IPv6 traffic.
MAC source and/or destination address: inbound, outbound, or both.

5. On the source switch:
   a. Enter the `mirror` command with the session number (1 to 4) and the IP addresses and UDP port number from 1 on page 415 to configure a mirroring session. If desired, enter the `[truncation]` parameter to allow oversize packets to be truncated rather than dropped.
   b. Enter one of the following commands to configure one or more of the traffic-selection methods in 4 on page 415 for the configured session:

   ```
   interface port/trunk/mesh [monitor | service-policy policy-name in] vlan vid [monitor | service-policy policy-name in] monitor mac mac-addr
   ```

   After you complete 5b, the switch begins mirroring traffic to the remote destination (endpoint) configured for the session.

**Quick reference to remote mirroring setup**

Commands to configure mirroring for a remote session in which the mirroring source and destination are on different switches:

- The `mirror` command identifies the destination in a mirroring session.
- The `interface` and `vlan` commands identify the monitored interface, traffic direction, and traffic-selection criteria for a specified session.

*CAUTION:* When configuring a remote mirroring session, always configure the destination switch first. Configuring the source switch first can result in a large volume of mirrored, IPv4-encapsulated traffic arriving at the destination without an exit path, which can slow switch performance.

**High-level overview of the mirror configuration process**

**Determine the mirroring session and destination**

**For a local mirroring session**
Determine the port number for the exit port (such as A5, B10, and so forth).

**For a remote mirroring session**
Determine the following information and then go to.

- The IP address of the VLAN or subnet on which the exit port exists on the destination switch.
- The port number of the remote exit port on the remote destination switch. (In a remote mirroring endpoint, the IP address of the exit port and the remote destination switch can belong to different VLANs.)
- The IP address of the VLAN or subnet on which the mirrored traffic enters or leaves the source switch.
CAUTION: Although the switch supports the use of UDP port numbers from 1 to 65535, UDP port numbers below 7933 are reserved for various IP applications. Using these port numbers for mirroring can result in an interruption of other IP functions, and in non-mirrored traffic being received on the destination (endpoint) switch and sent to the device connected to the remote exit port.

- The unique UDP port number to use for the session on the source switch. (The recommended port range is from 7933 to 65535.)

Configure a mirroring destination on a remote switch

This step is required only if you are configuring a remote mirroring session in which the exit port is on a different switch than the monitored (source) interface.

For remote mirroring, you must configure the destination switch to recognize each mirroring session and forward mirrored traffic to an exit port before you configure the source switch. Configure the destination switch with the values you determined for remote mirroring in Determine the mirroring session and destination.

NOTE: A remote destination switch can support up to 32 remote mirroring endpoints (exit ports connected to a destination device in a remote mirroring session.)

Configure a destination switch in a remote mirroring session

Enter the mirror endpoint ip command on the remote switch to configure the switch as a remote endpoint for a mirroring session with a different source switch.

Configure a mirroring session on the source switch

To configure local mirroring, exit port number is all that is required.

If the exit port for a mirroring destination is on a remote switch instead of the local (source) switch, you must enter the source IP address, destination IP address, and UDP port number for the remote mirroring session. You may also wish to enable frame truncation to allow oversize frames to be truncated rather than dropped.

Frames that exceed the maximum size (MTU) are either dropped or truncated, according to the setting of the [truncation] parameter in the mirror command.

Frames that are near the MTU size may become oversize when the 54-byte remote mirroring tunnel header is added for transport between source switch and destination switch.

(The addition of the header is a frequent cause for frames becoming oversize, but note that all oversize frames, whatever the cause of their excess size, are dropped or truncated.) If a frame is truncated, bytes are removed from the end of the frame. This may cause the checksum in the original frame header to fail. Some protocol analyzers may flag such a checksum mismatch as an alert.

NOTE: Note that if you enable jumbo frames to allow large frames to be transmitted, you must enable jumbo frames on all switches in the path between source and destination switches.

Configure a source switch in a remote mirroring session

Enter the mirror remote ip command on the source switch to configure a remote destination switch for a mirroring session on the source switch. The source IP address, UDP port number, and destination IP address that you enter must be the same values that you entered with the mirror endpoint ip command.
CAUTION: After you configure a mirroring session with traffic-selection criteria and a destination, the switch immediately starts to mirror traffic to the destination device connected to each exit port. In a remote mirroring session that uses IPv4 encapsulation, if the remote (endpoint) switch is not already configured as the destination for the session, its performance may be adversely affected by the stream of mirrored traffic. For this reason, Hewlett Packard Enterprise strongly recommends that you configure the endpoint switch in a remote mirroring session, as described on the previous page in the section titled "For a remote mirroring session", before using the `mirror remote ip` command in this section to configure the mirroring source for the same session.

Configure the monitored traffic in a mirror session

This step configures one or more interfaces on a source switch with traffic-selection criteria to select the traffic to be mirrored in a local or remote session configured in section.

Traffic selection options

To configure traffic mirroring, specify the source interface, traffic direction, and criteria to be used to select the traffic to be mirrored by using the following options:

- Interface type
  - Port, trunk, and/or mesh
  - VLAN
  - Switch (global configuration level)

- Traffic direction and selection criteria
  - All inbound and/or outbound traffic on a port or VLAN interface
  - Only inbound IP traffic selected with an ACL (deprecated in software release K.14.01 and greater)
  - Only inbound IPv4 or IPv6 traffic selected with a classifier-based mirroring policy
  - All inbound and/or outbound traffic selected by MAC source and/or destination address

The different ways to configure traffic-selection criteria on a monitored interface are described in the following sections.

Mirroring-source restrictions

In a mirroring session, you can configure any of the following sources of mirrored traffic:

- Multiple port and trunk, and/or mesh interfaces
- One VLAN
- One classifier-based policy

If you configure a VLAN as the source interface in a mirroring session and assign a second VLAN to the session, the second VLAN overwrites the first VLAN as the source of mirrored traffic.

- Up to 320 MAC addresses (used to select traffic according to source, destination MAC address, or both) in all mirroring sessions configured on a switch
About selecting all inbound/outbound traffic to mirror

If you have already configured session 1 with a local or remote destination, you can enter the `vlan vid` monitor or `interface port monitor` command without additional parameters for traffic-selection criteria and session number to configure mirroring for all inbound and outbound traffic on the specified VLAN or port interfaces in session 1 with the preconfigured destination.

Untagged mirrored packets

Although a VLAN tag is added (by default) to the mirrored copy of untagged outbound packets to indicate the source VLAN of the packet, it is sometimes desirable to have mirrored packets look exactly like the original packet. The `no-tag-added` parameter gives you the option of not tagging mirrored copies of outbound packets, as shown in Figure 65: Mirroring commands with the no-tag-added option on page 419 and Figure 66: Displaying a mirror session configuration with the no-tag-added option on page 419.

Figure 65: Mirroring commands with the no-tag-added option

```
Switch(config)#interface 3 monitor all in mirror 1 no-tag-added
Switch(config)#interface mesh monitor all both mirror 1 no-tag-added
```

Figure 66: Displaying a mirror session configuration with the no-tag-added option

```
Switch# show monitor 1
Network Monitoring
    Session: 1   Session Name: 
    ACL: no ACL relationship exists
    Mirror Destination: 48
    Untagged traffic : untagged
    Monitoring Sources Direction
    ------------------------ -------
    Port: 3           Both

Indicates the no-tag-added option is configured.
```

About using SNMP to configure no-tag-added

The MIB object `hpicfBridgeDontTagWithVlan` is used to implement the no-tag-added option, as shown below:

```
hpicfBridgeDontTagWithVlan OBJECT-TYPE
SYNTAX   INTEGER
    {   enabled(1),
        disabled(2)
    }
MAX-ACCESS   read-write
STATUS   current
DESCRIPTION
    "This oid mentions whether VLAN tag is part of the mirror'ed copy of the packet. The value 'enabled'
denotes that the VLAN tag shouldn't be part of the mirror'ed copy; 'disabled' does put the VLAN tag in the mirror'ed copy. Only one logical port is allowed. This object is persistent and when written the entity SHOULD save the change to non-volatile storage."
```
Operating notes

The following conditions apply for the no-tag-added option:

• The specified port can be a physical port, trunk port, or mesh port.
• Only a single logical port (physical port or trunk) can be associated with a mirror session when the no-tag-added option is specified. No other combination of ACL mirroring, VLAN mirroring, or port mirroring can be associated with the mirror session. If more than one logical port is specified, the following error message is displayed:

  Cannot monitor more than one logical port with no-tag-added option
• If a port changes its VLAN membership and/or untagged status within the VLAN, the "untagged port mirroring" associated with that port is updated when the configuration change is processed.
• Only four ports or trunks can be monitored at one time when all four mirror sessions are in use (one logical port per mirror session) without VLAN tags being added to a mirrored copy.
• The no-tag-added option can also be used when mirroring is configured with SNMP.
• A VLAN tag is still added to the copies of untagged packets obtained via VLAN-based mirroring.

About selecting inbound/outbound traffic using a MAC address

Use the monitor mac mirror command at the global configuration level to apply a source and/or destination MAC address as the selection criteria used in a local or remote mirroring session.

While classifier-based mirroring allows you to mirror traffic using a policy to specify IP addresses as selection criteria, MAC-based mirroring allows you monitor switch traffic using a source and/or destination MAC address. You can apply MAC-based mirroring in one or more mirroring sessions on the switch to monitor:

• Inbound traffic
• Outbound traffic
• Both inbound and outbound traffic

MAC-based mirroring is useful in Switch Network Immunity security solutions that provide detection and response to malicious traffic at the network edge. After isolating a malicious MAC address, a security administrator can mirror all traffic sent to and received from the suspicious address for troubleshooting and traffic analysis.

The MAC address that you enter with the monitor mac mirror command is configured to select traffic for mirroring from all ports and learned VLANs on the switch. Therefore, a suspicious MAC address used in wireless applications can be continuously monitored as it re-appears in switch traffic on different ports or VLAN interfaces.

You can configure MAC-based mirroring from the CLI or an SNMP management station and use it to mirror:

• All inbound and outbound traffic from a group of hosts to one destination device.
• Inbound and/or outbound traffic from each host to a different destination device.
• Inbound and outbound traffic from all monitored hosts separately on two destination devices: mirroring all inbound traffic to one device and all outbound traffic to another device.

Restrictions

The following restrictions apply to MAC-based mirroring:
• Up to 320 different MAC addresses are supported for traffic selection in all mirroring sessions configured on the switch.

• A destination MAC address is not supported as mirroring criteria for routed traffic, because in routed packets, the destination MAC address is changed to the next-hop address when the packet is forwarded. Therefore, the destination MAC address that you want to mirror will not appear in routed packet headers.

This restriction also applies to the destination MAC address of a host that is directly connected to a routing switch. (Normally, a host is connected to an edge switch, which is directly connected to the router.)

To mirror routed traffic, we recommend that you use classifier-based policies to select IPv4 or IPv6 traffic for mirroring, as described in.

• On a switch, you can use a MAC address only once as a source MAC address and only once as a destination MAC address to filter mirrored traffic.

For example, after you enter the following commands:

```
monitor mac 111111-222222 src mirror 1
monitor mac 111111-222222 dest mirror 2
```

The following commands are not supported:

```
monitor mac 111111-222222 src mirror 3
monitor mac 111111-222222 dest mirror 4
```

In addition, if you enter the `monitor mac 111111-222222 both mirror 1` command, you cannot use the MAC address `111111-222222` in any other `monitor mac mirror` configuration commands on the switch.

• To re-use a MAC address that has already been configured as a source and/or destination address for traffic selection in a mirror session, you must first remove the configuration by entering the no form of the command and then re-enter the MAC address in a new `monitor mac mirror` command.

For example, if you have already configured MAC address `111111-222222` to filter inbound and outbound mirrored traffic, and you decide to use it to filter only inbound traffic in a mirror session, you could enter the following commands:

```
monitor mac 111111-222222 both mirror 1
no monitor mac 111111-222222 both mirror 1
monitor mac 111111-222222 src mirror 1
```

• A mirroring session in which you configure MAC-based mirroring is not supported on a port, trunk, mesh, or VLAN interface on which a mirroring session with a classifier-based mirroring policy is configured.

### About selecting inbound traffic using advanced classifier-based mirroring

In addition to the traffic selection options, traffic mirroring supports the use of advanced classifier-based functions that provide:

• A finer granularity for selecting the inbound IP traffic that you want to mirror on an individual port or VLAN interface (instead of mirroring all inbound traffic on the interface)

• Support for mirroring both IPv4 and IPv6 traffic

• The ability to re-use the same traffic classes in different software-feature configurations; for example, you can apply both a QoS rate-limiting and mirroring policy on the same class of traffic.
Classifier-based mirroring policies provide greater precision when analyzing and debugging a network traffic problem. Using multiple match criteria, you can finely select and define the classes of traffic that you want to mirror on a traffic analyzer or IDS device.

**Classifier-based mirroring configuration**

1. Evaluate the types of traffic in your network and identify the traffic types that you want to mirror.
2. Create an IPv4 or IPv6 traffic class using the `class` command to select the packets that you want to mirror in a session on a preconfigured local or remote destination device.

   A traffic class consists of match criteria, which consist of match and ignore commands.

   - **match** commands define the values that header fields must contain for a packet to belong to the class and be managed by policy actions.
   - **ignore** commands define the values which, if contained in header fields, exclude a packet from the policy actions configured for the class.

   **NOTE:** Be sure to enter match/ignore statements in the precise order in which you want their criteria to be used to check packets.

   The following match criteria are supported in match/ignore statements for inbound IPv4/IPv6 traffic:

   - IP source address (IPv4 and IPv6)
   - IP destination address (IPv4 and IPv6)
   - IP protocol (such as ICMP or SNMP)
   - Layer 3 IP precedence bits
   - Layer 3 DSCP codepoint
   - Layer 4 TCP/UDP application port (including TCP flags)
   - VLAN ID

   Enter one or more match or ignore commands from the class configuration context to filter traffic and determine the packets on which policy actions will be performed.

3. Create a mirroring policy to configure the session and destination device to which specified classes of inbound traffic are sent by entering the `policy mirror` command from the global configuration context.

   **NOTE:** Be sure to enter each class and its associated mirroring actions in the precise order in which you want packets to be checked and processed.

   To configure the mirroring actions that you want to execute on packets that match the criteria in a specified class, enter one or more class action mirror commands from the policy configuration context.

   You can configure only one mirroring session (destination) for each class. However, you can configure the same mirroring session for different classes.

   A packet that matches the match criteria in a class is mirrored to the exit (local or remote) port that has been previously configured for the session, where session value is 1 or a text string (if you configured the session with a name when you entered the `mirror` command.)

   Prerequisite: The local or remote exit port for a session must be already configured before you enter the `mirror session` parameter in a class action statement:
In a local mirroring session, the exit port is configured with the `mirror <session-number> port` command.

In a remote mirroring session, the remote exit port is configured with the `mirror endpoint ip` and `mirror <session-number> remote ip` commands.

Restriction: In a policy, you can configure only one mirroring session per class. However, you can configure the same session for different classes.

Mirroring is not executed on packets that match ignore criteria in a class.

The execution of mirroring actions is performed in the order in which the classes are numerically listed in the policy.

The complete no form of the `class action mirror` command or the `no <seq-number>` command removes a class and mirroring action from the policy configuration.

To manage packets that do not match the match or ignore criteria in any class in the policy, and therefore have no mirroring actions performed on them, you can enter an optional default class. The default class is placed at the end of a policy configuration and specifies the mirroring actions to perform on packets that are neither matched nor ignored.

4. (Optional) To configure a default-class in a policy, enter the `default-class` command at the end of a policy configuration and specify one or more actions to be executed on packets that are not matched and not ignored.

Prerequisite: The local or remote exit port for a session must be already configured with a destination device before you enter the `mirror <session>` parameter in a default-class action statement.

5. Apply the mirroring policy to inbound traffic on a port (`interface service-policy in` command) or VLAN (`vlan service-policy in` command) interface.

**CAUTION:** After you apply a mirroring policy for one or more preconfigured sessions on a port or VLAN interface, the switch immediately starts to use the traffic-selection criteria and exit port to mirror traffic to the destination device connected to each exit port.

In a remote mirroring session that uses IPv4 encapsulation, if the remote switch is not already configured as the destination for the session, its performance may be adversely affected by the stream of mirrored traffic.

For this reason, Hewlett Packard Enterprise strongly recommends that you first configure the exit switch in a remote mirroring session before you apply a mirroring service policy on a port or VLAN interface.

Restrictions: The following restrictions apply to a mirroring service policy:

- Only one mirroring policy is supported on a port or VLAN interface.
- If you apply a mirroring policy to a port or VLAN interface on which a mirroring policy is already configured, the new policy replaces the existing one.
- A mirroring policy is supported only on inbound traffic.

Because only one mirroring policy is supported on a port or VLAN interface, ensure that the policy you want to apply contains all the required classes and actions for your configuration.

**Classifier-based mirroring restrictions**

The following restrictions apply to mirroring policies configured with the classifier-based model:
• A mirroring policy is supported only on **inbound** IPv4 or IPv6 traffic.

• A mirroring policy is not supported on a meshed port interface. (Classifier-based policies are supported only on a port, VLAN, or trunk interface.)

• Only one classifier-based mirroring policy is supported on a port or VLAN interface. You can, however, apply a classifier-based policy of a different type, such as QoS.

• You can enter multiple `class action mirror` statements in a policy.
  ◦ You can configure only one mirroring session (destination) for each class.
  ◦ You can configure the same mirroring session for different classes.

• If a mirroring session is configured with a classifier-based mirroring policy on a port or VLAN interface, no other traffic-selection criteria (MAC-based or all inbound and/or outbound traffic) can be added to the session. 

  **Figure 67: Mirroring configuration in which only a mirroring policy is supported**

  ```
  Switch-B(config)# mirror endpoint 10.10.40.4 9200 10.10.50.5 port a1
  ... Switch-B(config)# mirror 1 remote ip 10.10.40.4 9200 10.10.50.5
  Caution: Please configure destination switch first.
  Do you want to continue [y/n]? y
  Switch-A(config)# class ipv4 Data2
  Switch-A(config-class)# match ip 10.28.31.1 any
  Switch-A(config-class)# match ip any host 10.28.31.0/24
  Switch-A(config-class)# exit
  Switch-A(config)# policy mirror SalesData
  Switch-A(config-policy)# class ipv4 Data2 action mirror 1
  Switch-A(config-policy)# exit
  Switch-A(config)# vlan 10 service-policy SalesData in
  Switch-A(config)# vlan 10 monitor all out mirror 1
  A prior mirror policy relationship exists with mirror session 1. Please remove.
  ```

• If a mirroring session is already configured with one or more traffic-selection criteria (MAC-based or all inbound and/or outbound traffic), the session does not support the addition of a classifier-based policy.

  **Figure 68: Mirroring configuration in which only traffic-selection criteria are supported**

  ```
  Switch-B(config)# mirror endpoint 10.10.40.4 9200 10.10.50.5 port a1
  ... Switch-B(config)# mirror 1 remote ip 10.10.40.4 9200 10.10.50.5
  Caution: Please configure destination switch first.
  Do you want to continue [y/n]? y
  Switch-A(config)# vlan 10 monitor all out mirror 1
  Switch-A(config-class)# class ipv4 Data2
  Switch-A(config-class)# match ip 10.28.31.1 any
  Switch-A(config-class)# match ip any host 10.28.31.0/24
  Switch-A(config-class)# exit
  Switch-A(config-class)# class ipv4 Data2 action mirror 1
  Switch-A(config-class)# exit
  Switch-A(config)# policy mirror SalesData
  Switch-A(config-policy)# class ipv4 Data2 action mirror 1
  Switch-A(config-policy)# exit
  Switch-A(config)# vlan 10 service-policy SalesData in
  Mirror source VLAN exists on mirror session 1. Cannot add this mirror source.
  ```

**About applying multiple mirroring sessions to an interface**

You can apply a mirroring policy to an interface that is already configured with another traffic-selection method (MAC-based or all inbound and/or outbound traffic) for a different mirroring session.

The classifier-based policy provides a finer level of granularity that allows you to zoom in on a subset of port or VLAN traffic and select it for local or remote mirroring.
In the following example, traffic on Port b1 is used as the mirroring source for two different, local mirroring sessions:

- All inbound and outbound traffic on Ports b1, b2, and b3 is mirrored in session 4.
- Only selected voice traffic on Port b1 is mirrored in session 2.

**Figure 69: Example of applying multiple sessions to the same interface**

<table>

</tbody>
</table>

**Mirroring configuration examples**

**Local mirroring using traffic-direction criteria**

An administrator wants to mirror the inbound traffic from workstation "X" on port A5 and workstation "Y" on port B17 to a traffic analyzer connected to port C24 (see Figure 70: Local mirroring topology on page 425.) In this case, the administrator chooses "1" as the session number. (Any unused session number from 1 to 4 is valid.) Because the switch provides both the source and destination for the traffic to monitor, local mirroring can be used. In this case, the command sequence is:

- Configure the local mirroring session, including the exit port.
- Configure the monitored source interfaces for the session.

**Figure 70: Local mirroring topology**

**Figure 71: Configuring a local mirroring session for all inbound and outbound port traffic**
Remote mirroring using a classifier-based policy

In the network shown in the figure below, an administrator has connected a traffic analyzer to port A15 (in VLAN 30) on switch C to monitor the TCP traffic to the server at 10.10.30.153 from workstations connected to switches A and B. Remote mirroring sessions are configured on switches A and B, and a remote mirroring endpoint on switch C. TCP traffic is routed through the network to the server from VLANs 10 and 20 on VLAN 30.

Figure 72: Sample topology in a remote mirroring session

To configure this remote mirroring session using a classifier-based policy to select inbound TCP traffic on two VLAN interfaces, take the following steps:

1. On remote switch C, configure a remote mirroring endpoint using port A15 as the exit port (as described in Configure a mirroring destination on a remote switch on page 417.)

   Figure 73: Configuring a remote mirroring endpoint: remote switch and exit port

   ```
   Switch-C(config)# mirror endpoint 10.10.10.119 9308 10.10.30.2 port a15
   Switch-C(config)# mirror endpoint 10.20.145.9300 10.10.30.2 port a15
   ```

2. On source switch A, configure an association between the remote mirroring endpoint on switch C and a mirroring session on switch A (as described in Configure a mirroring session on the source switch on page 417.)
3. On switch A, configure a classifier-based mirroring policy to select inbound TCP traffic destined to the server at 10.10.30.153, and apply the policy to the interfaces of VLAN 10 (as described in About selecting inbound traffic using advanced classifier-based mirroring on page 421.)

**Figure 74: Configuring a classifier-based policy on source switch A**

```
1 Switch-A(config)# mirror 1 remote ip 10.10.119.9300 10.10.30.2
   Caution: Please configure destination switch first.
   Do you want to continue [y/n]? y
2 Switch-A(config)# class ipv4 tcp7
   Switch-A(config)# class ipv4 tcp7 action mirror 1
   Switch-A(config)# policy mirror mirrorTCP
   Switch-A(config)# policy mirror TCP
2 Switch-A(config)# class ipv4 tcp7 action mirror 1
   Switch-A(config)# policy mirror TCP
3 Switch-A(config)# vlan 10 service-policy mirrorTCP in
```

4. On source switch B, repeat steps 2 and 3:
   a. Configure an association between the remote mirroring endpoint on switch C and a mirroring session on switch B.
   b. Configure a classifier-based mirroring policy to select inbound TCP traffic destined to the server at 10.10.30.153, and apply the policy to a VLAN interface for VLAN 20.
Because the remote session has mirroring sources on different switches, you can use the same session number (1) for both sessions.

**Figure 75: Configuring a classifier-based policy on source switch B**

```bash
Switch-B(config)# mirror 1 remote ip 10.10.20.145 9300 10.10.30.2
Caution: Please configure destination switch first.
Do you want to continue [y/n]? y
Switch-B(config)# class ipv4 tcp7
Switch-B(config)# match tcp any 10.10.30.153
Switch-B(config)# match tcp any host 10.10.20.153/24
Switch-B(config)# match tcp any any eq 80
Switch-B(config)# exit
Switch-B(config)# policy mirror mirrorTCP
Switch-B(policy-config)# class ipv4 tcp7 mirror 1
Switch-B(policy-config)# exit
Switch-B(config)# vlan 20 service-policy mirrorTCP in
```

**Remote mirroring using traffic-direction criteria**

In the network shown in the figure below, the administrator connects another traffic analyzer to port B10 (in VLAN 40) on switch C to monitor all traffic entering switch A on port C12. For this mirroring configuration, the administrator configures a mirroring destination (with a remote exit port of B10) on switch C, and a remote mirroring session on switch A.

If the mirroring configuration in the proceeding example is enabled, it is necessary to use a different session number (2) and UDP port number (9400.) (The IP address of the remote exit port [10.10.40.7] connected to traffic analyzer 2 [exit port B10] can belong to a different VLAN than the destination IP address of the VLAN used to reach remote switch C [10.20.40.1]).

**Figure 76: Sample topology for remote mirroring from a port interface**

To configure this remote mirroring session using a directional-based traffic selection on a port interface, the operator must take the following steps:
1. On remote switch C, configure the remote mirroring endpoint using port B10 as the exit port for a traffic analyzer (as described in Configure a mirroring destination on a remote switch on page 417):

Figure 77: Configuring a remote mirroring endpoint

```
Switch-C(config)# mirror endpoint ip 10.10.119 9400 10.10.40.1
```

2. On source switch A, configure session 2 to use UDP port 9400 to reach the remote mirroring endpoint on switch C (10.10.40.1):

```
mirror 2 remote ip 10.10.119 9400 10.10.40.1
```

3. On source switch A, configure the local port C12 to select all inbound traffic to send to the preconfigured mirroring destination for session 2:

```
interface c12 monitor all in mirror 2
```

Figure 78: Configuring a remote mirroring session for inbound port traffic

**Maximum supported frame size**

The IPv4 encapsulation of mirrored traffic adds a 54-byte header to each mirrored frame. If a resulting frame exceeds the MTU allowed in the network, the frame is dropped or truncated.

**NOTE:**

Oversized mirroring frames are dropped or truncated, according to the setting of the truncation parameter in the mirror command. Also, remote mirroring does not allow downstream devices in a mirroring path to fragment mirrored frames.

If jumbo frames are enabled on the mirroring source switch, the mirroring destination switch and all downstream devices connecting the source switch to the mirroring destination must be configured to support jumbo frames.
Enabling jumbo frames to increase the mirroring path MTU

On 1-Gbps and 10-Gbps ports in the mirroring path, you can reduce the number of dropped frames by enabling jumbo frames on all intermediate switches and routers. (The MTU on the switches covered by this manual is 9220 bytes for frames having an 802.1Q VLAN tag, and 9216 bytes for untagged frames.)

Table 28: Maximum frame sizes for mirroring

<td>1522</td>
<td>4</td>
<td>n/a(^{2})</td>
<td>1468</td>
</tr>
</tbody>
</table>

1 Jumbo frames are allowed on ports operating at or above 1 Gbps
2 For local mirroring, a non-jumbo configuration on the source VLAN dictates an MTU of 1518 bytes for untagged frames, and an MTU of 1522 for tagged frames, regardless of the jumbo configuration on any other VLANs on the switch.

Effect of downstream VLAN tagging on untagged, mirrored traffic

In a remote mirroring application, if mirrored traffic leaves the switch without 802.1Q VLAN tagging, but is forwarded through a downstream device that adds 802.1Q VLAN tags, the MTU for untagged mirrored frames leaving the source switch is reduced below the values shown in Maximum frame sizes for mirroring.
For example, if the MTU on the path to the destination is 1522 bytes, untagged mirrored frames leaving the source switch cannot exceed 1518 bytes. Likewise, if the MTU on the path to the destination is 9220 bytes, untagged mirrored frames leaving the source switch cannot exceed 9216 bytes.

**Figure 79: Effect of downstream VLAN tagging on the MTU for mirrored traffic**

---

**Operating notes for traffic mirroring**

- **Mirroring dropped traffic**

  When an interface is configured to mirror traffic to a local or remote destination, packets are mirrored regardless of whether the traffic is dropped while on the interface. For example, if an ACL is configured on a VLAN with a *deny* ACE that eliminates packets from a Telnet application, the switch still mirrors the Telnet packets that are received on the interface and subsequently dropped.

- **Mirroring and spanning tree**

  Mirroring is performed regardless of the STP state of a port or trunk. This means, for example, that inbound traffic on a port blocked by STP can still be monitored for STP packets during the STP setup phase.

- **Tagged and untagged frames**

  For a frame entering or leaving the switch on a mirrored port, the mirrored copy retains the tagged or untagged state the original frame carried when it entered into or exited from the switch. (The tagged or untagged VLAN membership of ports in the path leading to the mirroring destination does not affect the tagged or untagged status of the mirrored copy itself.)

  Thus, if a tagged frame arrives on a mirrored port, the mirrored copy is also tagged, regardless of the status of ports in the destination path. If a frame exits from the switch on a mirrored port that is a tagged member of a VLAN, the mirrored copy is also tagged for the same reason.

  To prevent a VLAN tag from being added to the mirrored copy of an outbound packet sent to a mirroring destination, you must enter the `no-tag-added` parameter when you configure a port, trunk, or mesh interface to select mirrored traffic.

- **Effect of IGMP on mirroring**

  If both inbound and outbound mirroring is operating when IGMP is enabled on a VLAN, two copies of mirrored IGMP frames may appear at the mirroring destination.

- **Mirrored traffic not encrypted**

  Mirrored traffic undergoes IPv4 encapsulation, but mirrored encapsulated traffic is not encrypted.

- **IPv4 header added**

  The IPv4 encapsulation of mirrored traffic adds a 54-byte header to each mirrored frame. If a resulting frame exceeds the maximum MTU allowed in the network, it is dropped or truncated (according to the setting of the `truncation` parameter in the `mirror` command.)
To reduce the number of dropped frames, enable jumbo frames in the mirroring path, including all intermediate switches and/or routers. (The MTU on the switch is 9220 bytes, which includes 4 bytes for the 802.1Q VLAN tag.)

- Intercepted or injected traffic
  The mirroring feature does not protect against either mirrored traffic being intercepted or traffic being injected into a mirrored stream by an intermediate host.

- Inbound mirrored IPv4-encapsulated frames are not mirrored
  The switch does not mirror IPv4-encapsulated mirrored frames that it receives on an interface. This prevents duplicate mirrored frames in configurations where the port connecting the switch to the network path for a mirroring destination is also a port whose inbound or outbound traffic is being mirrored.

  For example, if traffic leaving the switch through ports B5, B6, and B7 is being mirrored through port B7 to a network analyzer, the mirrored frames from traffic on ports B5 and B6 will not be mirrored a second time as they pass through port B7.

- Switch operation as both destination and source
  A switch configured as a remote destination switch can also be configured to mirror traffic to one of its own ports (local mirroring) or to a destination on another switch (remote mirroring.)

- Monitor command note
  If session 1 is already configured with a destination, you can enter the [no] vlan <VID>monitor or [no] interface <PORT> monitor command without mirroring criteria and a mirror session number. In this case, the switch automatically configures or removes mirroring for inbound and outbound traffic from the specified VLAN or ports to the destination configured for session 1.

- Loss of connectivity suspends remote mirroring
  When a remote mirroring session is configured on a source switch, the switch sends an ARP request to the configured destination approximately every 60 seconds. If the source switch fails to receive the expected ARP response from the destination for the session, transmission of mirrored traffic in the session halts. However, because the source switch continues to send ARP requests for each configured remote session, link restoration or discovery of another path to the destination enables the source switch to resume transmitting the session's mirrored traffic after a successful ARP response cycle occurs.

  Note that if a link's connectivity is repeatedly interrupted ("link toggling"), little or no mirrored traffic may be allowed for sessions using that link. To verify the status of any mirroring session configured on the source switch, use the show monitor command.

### Troubleshooting traffic mirroring

#### Cause

If mirrored traffic does not reach the configured remote destination (endpoint) switch or remote exit port, check the following configurations:

- The configured remote exit port must not be a member of a trunk or mesh.
- If the destination for mirrored traffic is on a different VLAN than the source, routing must be correctly configured along the path from the source to the destination.

---

**CAUTION:** A mirroring exit port should be connected only to a network analyzer, IDS, or other network edge device that has no connection to other network resources. Configuring a mirroring exit port connection to a network can result in serious network performance problems, and is strongly discouraged.
Interface monitoring features

You can designate monitoring of inbound and outbound traffic on:

**Ports and static trunks**: Allows monitoring of individual ports, groups of contiguous ports, and static port trunks.

The switch monitors network activity by copying all traffic inbound and outbound on the specified interfaces to the designated monitoring port, to which a network analyzer can be attached.

If a tagged packet arrives on a monitored port, the packet will remain tagged when it goes out a monitored port even if that port is configured as untagged. If the packet is untagged, it will remain untagged going out the monitor port. The monitor port state (tagged or untagged) does not affect the tagging of the packet. However, egress mirroring does not reflect the tagged or untagged characteristic to the mirror port, instead it reflects the tagged or untagged characteristic of the mirror port.

**NOTE**: When both inbound and outbound monitoring is done, and IGMP is enabled on any VLAN, you may get two copies of IGMP packets on the monitored port.

Port trunks cannot be used as a monitoring port.

The switch can monitor static LACP trunks, but not dynamic LACP trunks.

It is possible, when monitoring multiple interfaces in networks with high traffic levels, to copy more traffic to a monitor port than the link can support. In this case, some packets may not be copied to the monitor port.

Configuring port and static trunk monitoring (CLI)

You must use the following configuration sequence to configure port and static trunk monitoring in the CLI:

1. Assign a monitoring (mirror) port.
2. Designate the port(s) and/or static trunk(s) to monitor.

**Displaying the monitoring configuration**

**Syntax:**

```
show monitor
```

This command lists the port assigned to receive monitored traffic and the ports and/or trunks being monitored.

For example, if you assign port 5 as the monitoring port and configure the switch to monitor ports 2-4, `show monitor` displays the following:

**Monitored port listing**

```
switch(config)# show monitor
Network Monitoring Port
Mirror Port: 5  
Monitoring sources  
---------------
2
3
4
```
• ¹Port receiving monitored traffic.
• ²Monitored Ports

Configuring the monitor port

Syntax:

```
[no] mirror-port [<port-num>]
```

This command assigns or removes a monitoring port, and must be executed from the global configuration level. Removing the monitor port disables port monitoring and resets the monitoring parameters to their factory-default settings.

For example, to assign port 6 as the monitoring port:
```
switch(config)# mirror-port 6
```

To turn off monitoring:
```
switch(config)# no mirror-port
```

Selecting or removing monitoring source interfaces

After you configure a monitor port you can use either the global configuration level or the interface context level to select ports, static trunks, or VLANs as monitoring sources. You can also use either level to remove monitoring sources.

Syntax:

```
[no] interface <monitor-list> monitor
```

<table>
<thead>
<tr>
<th>&lt;monitor-list&gt;</th>
<th>Includes port numbers and static trunk names such as 4, 7, 5-8, trk1.</th>
</tr>
</thead>
</table>

**NOTE:** Individual ports and static trunks can be monitored at the same time. However, if you configure the switch to monitor a VLAN, all other interfaces are removed from monitoring. Also, you can configure only one VLAN at a time for monitoring.

Elements in the monitor list can include port numbers and static trunk names at the same time.

For example, with a port such as port 5 configured as the monitoring (mirror) port, you would use either of the following commands to select these interfaces for monitoring:

- Ports 6-9, and 14
- Trunk 2

```
switch(config)# int 6-9, 14 trk2, monitor
```

To monitor a VLAN:
```
switch(config)# vlan 20 monitor
switch(config)# show monitor
```
Network Monitoring Port

Mirror Port: 5

Monitoring sources
------------------
VLAN_20

Disabling monitoring at the interface context and the global config level

```
switch(eth-1-3, 5)# no int 5 monitor ¹
switch(eth-1-3, 5)# no monitor

switch(config)# no int 5 monitor ²
switch(config)# no int 1-3, 5 monitor
```

¹ These two commands show how to disable monitoring at the interface context level for a single port or all ports in an interface context level.

² These two commands show how to disable monitoring at the global config level for a single port or a group of ports.

Fans

There are three fan types:

- Power supply fans
- Fan-tray fans
- Stacking switch fans

**show system**

**Syntax**

```
show system [chassislocate | information | temperature]
```

**Description**

Shows global system information and operational parameters for the switch.

**Command context**

manager and operator

**Parameters**

- **chassislocate**
  Shows the chassis locator LED status. Possible values are ON, Off, and Blink. When the status is On or Blink, the number of minutes that the Locator LED will continue to be on or to blink is displayed.

- **information**
  Displays global system information and operational parameters for the switch.

- **temperature**
  Shows system temperature and settings.
Usage

- To show system fans, see `show system fans`
- To show chassis power supply and settings, see `show system power-supply`
- To show system fans for VSF members, see `show system fans vsf`

Examples

Locating the system chassis by LED blink using the `show system chassislocate` command.

```
Switch(config)# show system chassislocate
Chassis Locator LED: ON 5 minutes 5 seconds
Switch(config)# show system chassislocate
Chassis Locator LED: BLINK 10 minutes 6 seconds
Switch(config)# show system chassislocate
Chassis Locator LED: OFF
```

Showing the general switch system information by using the `show system` command.

```
Switch(config)# show system
Status and Counters - General System Information

```

`show system fans`

Syntax

`show system fans`

Description

Shows the state, status, and location of system fans.

Command context

manager and operator
Usage

Command can be executed using various command contexts. See examples for use of command context PoEP and VSF.

Examples

The state of all system fans is shown by using the command `show system fans`.

Switch# `show system fans`

```

```
show system power-supply
```

Syntax

```
show system power-supply [detailed | fahrenheit]
```

Description

Shows power supply information in either full detail or full detail in Fahrenheit only. Default temperature is displayed in degrees Celsius.

Command context

`manager and operator`
Parameters
detailed

Shows detailed switch power supply sensor information.

fahrenheit

Shows detailed switch power supply sensor information with temperatures in degrees Fahrenheit.

Usage

- The `show system power-supply detailed` command shows detailed information for the local power supplies only.
- The `show system power-supply detailed` command shows detailed information for power supplies in the powered state only.

Examples

Use of the command `show system power-supply` shows the power supply status for all active switches.

```
Switch# show system power-supply
Power Supply Status:

**Fan failures and SNMP traps**

**Power supply fan-fault**

Power supply events indicating an internal fan-fault are reported by SNMP traps issued up to 10 seconds after the corresponding power supply fan fault occurs.

For single event power supply fan faults, a corresponding SNMP trap is issued.

**Single event and corresponding SNMP trap issued for a power supply fan-fault and recovery**

Shown is a fan-fault (fan 1 of 2) and spontaneous recovery a few seconds after within power supply in bay number 2. The event is issued as informative (I).

```
I 11/30/16 14:01:59 02778 chassis: AM1: Internal power supply 2: Fan 1 OK.
```

**Fan-tray fan-fault events**

For single event fan-tray fan-faults, the corresponding SNMP traps are issued only for fans within the fan-tray.

**Single event and corresponding SNMP trap issued for a fan-tray fan-fault and recovery**

Shown is a fan-tray fan-fault (fan number 3) and spontaneous recovery a few seconds after. The event is issued as "Informative" (I).
Shown is a fan-tray fan-fault (fan number 3) failure. The event is issued as a "Warning" (w).
Overview

This chapter addresses performance-related network problems that can be caused by topology, switch configuration, and the effects of other devices or their configurations on switch operation. (For switch-specific information on hardware problems indicated by LED behavior, cabling requirements, and other potential hardware-related problems, see the installation guide you received with the switch.)

NOTE: Switch software updates are periodically placed on the Switch Networking website. It is recommended that you check this website for software updates that may have fixed a problem you are experiencing.

For information on support and warranty provisions, see the Support and Warranty booklet shipped with the switch.

Troubleshooting approaches

Cause

Use these approaches to diagnose switch problems:

- Check the HPE website for software updates that may have solved your problem: [http://www.hpe.com/networking](http://www.hpe.com/networking)

- Check the switch LEDs for indications of proper switch operation:
  - Each switch port has a Link LED that should light whenever an active network device is connected to the port.
  - Problems with the switch hardware and software are indicated by flashing the Fault and other switch LEDs. For a description of the LED behavior and information on using the LEDs for troubleshooting, see the installation guide shipped with the switch.

- Check the network topology/installation. For topology information, see the installation guide shipped with the switch.

- Check cables for damage, correct type, and proper connections. You should also use a cable tester to check your cables for compliance to the relevant IEEE 802.3 specification. For correct cable types and connector pinouts, see the installation guide shipped with the switch.

- Use the Port Utilization Graph and Alert Log in the WebAgent included in the switch to help isolate problems. These tools are available through the WebAgent:
  - Port Utilization Graph
  - Alert log
  - Port Status and Port Counters screens
  - Diagnostic tools (Link test, Ping test, configuration file browser)

- For help in isolating problems, use the easy-to-access switch console built into the switch or Telnet to the switch console. For operating information on the Menu and CLI interfaces included in the console, see chapters 3 and 4. These tools are available through the switch console:
Browser or Telnet access problems

Cannot access the WebAgent

- Access may be disabled by the Web Agent Enabled parameter in the switch console. Check the setting on this parameter by selecting:
  
  2. Switch Configuration
  1. System Information

- The switch may not have the correct IP address, subnet mask, or gateway. Verify by connecting a console to the switch’s Console port and selecting:

  2. Switch Configuration
  5. IP Configuration

  Note: If DHCP/Bootp is used to configure the switch, the IP addressing can be verified by selecting:

  1. Status and Counters...
  2. Switch Management Address Information

  Also check the DHCP/Bootp server configuration to verify correct IP addressing.

- If you are using DHCP to acquire the IP address for the switch, the IP address "lease time" may have expired so that the IP address has changed. For more information on how to "reserve" an IP address, see the documentation for the DHCP application that you are using.

- If one or more IP-authorized managers are configured, the switch allows inbound telnet access only to a device having an authorized IP address. For more information on IP Authorized managers, see the access security guide for your switch.

- Java™ applets may not be running on the web browser. They are required for the switch WebAgent to operate correctly. Refer to the online Help on your web browser for how to run the Java applets.

Cannot Telnet into the switch console from a station on the network

- Off-subnet management stations can lose Telnet access if you enable routing without first configuring a static (default) route. That is, the switch uses the IP default gateway only while operating as a Layer 2 device. While routing is enabled on the switch, the IP default gateway is not used. You can avoid this problem by using the ip route command to configure a static (default) route before enabling routing. For more information, see "IP Routing Features" in the multicast and routing guide for your switch.

- Telnet access may be disabled by the Inbound Telnet Enabled parameter in the System Information screen of the menu interface:

  2. Switch Configuration
  1. System Information

  The switch may not have the correct IP address, subnet mask, or gateway. Verify by connecting a console to the switch’s Console port and selecting:

  2. Switch Configuration
5. IP Configuration

- If you are using DHCP to acquire the IP address for the switch, the IP address "lease time" may have expired so that the IP address has changed. For more information on how to "reserve" an IP address, see the documentation for the DHCP application that you are using.

- If one or more IP-authorized managers are configured, the switch allows inbound telnet access only to a device having an authorized IP address. For more information on IP Authorized managers, see the access security guide for your switch.

Unusual network activity

Network activity that fails to meet accepted norms may indicate a hardware problem with one or more of the network components, possibly including the switch. Such problems can also be caused by a network loop or simply too much traffic for the network as it is currently designed and implemented. Unusual network activity is usually indicated by the LEDs on the front of the switch or measured with the switchconsole interface or with a network management tool. For information on using LEDs to identify unusual network activity, see the installation guide you received with the switch.

A topology loop can also cause excessive network activity. The Event Log "FFI" messages can be indicative of this type of problem.

General problems

The network runs slow; processes fail; users cannot access servers or other devices

Broadcast storms may be occurring in the network. These may be caused by redundant links between nodes.

- If you are configuring a port trunk, finish configuring the ports in the trunk before connecting the related cables. Otherwise you may inadvertently create a number of redundant links (that is, topology loops) that will cause broadcast storms.

- Turn on STP to block redundant links

- Check for FFI messages in the Event Log

Duplicate IP addresses

This is indicated by this Event Log message:

```
ip: Invalid ARP source: IP address on IP address
```

where both instances of IP address are the same address, indicating that the switch's IP address has been duplicated somewhere on the network.

Duplicate IP addresses in a DHCP network

If you use a DHCP server to assign IP addresses in your network, and you find a device with a valid IP address that does not appear to communicate properly with the server or other devices, a duplicate IP address may have been issued by the server. This can occur if a client has not released a DHCP-assigned IP address after the intended expiration time and the server "leases" the address to another device. This can also happen, For example, if the server is first configured to issue IP addresses with an unlimited duration, and then is subsequently configured to issue IP addresses that will expire after a limited duration. One solution is to configure "reservations" in the DHCP server for specific IP addresses to be assigned to devices having specific MAC addresses. For more information, see the documentation for the DHCP server.

One indication of a duplicate IP address in a DHCP network is this Event Log message:

```
ip: Invalid ARP source: <IP-address> on <IP-address>
```
where both instances of IP-address are the same address, indicating that the IP address has been duplicated somewhere on the network.

The switch has been configured for DHCP/Bootp operation, but has not received a DHCP or Bootp reply

When the switch is first configured for DHCP/Bootp operation, or if it is rebooted with this configuration, it immediately begins sending request packets on the network. If the switch does not receive a reply to its DHCP/Bootp requests, it continues to periodically send request packets, but with decreasing frequency. Thus, if a DHCP or Bootp server is not available or accessible to the switch when DHCP/Bootp is first configured, the switch may not immediately receive the desired configuration.

After verifying that the server has become accessible to the switch, reboot the switch to re-start the process.

802.1Q Prioritization problems

Ports configured for non-default prioritization (level 1 to 7) are not performing the specified action

If the ports were placed in a trunk group after being configured for non-default prioritization, the priority setting was automatically reset to zero (the default). Ports in a trunk group operate only at the default priority setting.

Addressing ACL problems

ACLs are properly configured and assigned to VLANs, but the switch is not using the ACLs to filter IP layer 3 packets

Procedure

1. The switch may be running with IP routing disabled. To ensure that IP routing is enabled, execute show running and look for the IP routing statement in the resulting listing. For Example:

```
switch(config)# show running
Running configuration:
 ; J9091A Configuration Editor; Created on release #XX.15.06
hostname "Switch"
ip default-gateway 10.33.248.1
ip routing

permit tcp 0.0.0.0 255.255.255.255 10.10.20.21 0.0.0.0 eq 80
deny tcp 0.0.0.0 255.255.255.255 10.10.20.1 0.0.0.255 eq 80
deny tcp 10.10.20.1? 0.0.0.0 10.10.10.100 0.0.0.0 eq 20 log
deny tcp 10.10.20.20 0.0.0.0 10.10.10.100 0.0.0.0 eq 20 log
deny tcp 10.10.20.43 0.0.0.0 10.10.10.100 0.0.0.0 eq 20 log
permit ip 10.10.20.1 0.0.0.255 10.10.10.100 0.0.0.0
deny ip 10.10.30.1 0.0.0.255 10.10.10.100 0.0.0.0
permit ip 10.10.30.1 0.0.0.255 10.10.10.1 0.0.0.255
exit
```

1
Indicates that routing is enabled, a requirement for ACL operation. (There is an exception. Refer to the Note, below.)

**NOTE:** If an ACL assigned to a VLAN includes an ACE referencing an IP address on the switch itself as a packet source or destination, the ACE screens traffic to or from this switch address regardless of whether IP routing is enabled. This is a security measure designed to help protect the switch from unauthorized management access.

If you need to configure IP routing, execute the `ip routing` command.

2. ACL filtering on the switches applies only to routed packets and packets having a destination IP address (DA) on the switch itself.

   Also, the switch applies assigned ACLs only at the point where traffic enters or leaves the switch on a VLAN. Ensure that you have correctly applied your ACLs ("in" and/or "out") to the appropriate VLANs.

**The switch does not allow management access from a device on the same VLAN**

The implicit `deny any` function that the switch automatically applies as the last entry in any ACL always blocks packets having the same DA as the switch's IP address on the same VLAN. That is, bridged packets with the switch itself as the destination are blocked as a security measure.

To preempt this action, edit the ACL to include an ACE that permits access to the switch's DA on that VLAN from the management device.

**Error (Invalid input) when entering an IP address**

When using the "host" option in the Command syntax, ensure that you are not including a mask in either dotted decimal or CIDR format. Using the "host" option implies a specific host device and therefore does not permit any mask entry.

**Correctly and incorrectly specifying a single host**

```plaintext
Switch(config)# access-list 6 permit host 10.28.100.100 ¹
Switch(config)# access-list 6 permit host 10.28.100.100 255.255.255.255²
Invalid input: 255.255.255.255
Switch(config)# access-list 6 permit host 10.28.100.100/32 ³
Invalid input: 10.28.100.100/32
```

- ¹Correct.
- ²Incorrect. No mask needed to specify a single host.
- ³Incorrect. No mask needed to specify a single host.

**Apparent failure to log all "deny" matches**

Where the `log` statement is included in multiple ACEs configured with a "deny" option, a large volume of "deny" matches generating logging messages in a short period of time can impact switch performance. If it appears that the switch is not consistently logging all "deny" matches, try reducing the number of logging actions by removing the `log` statement from some ACEs configured with the "deny" action.
The switch does not allow any routed access from a specific host, group of hosts, or subnet

The implicit deny any function that the switch automatically applies as the last entry in any ACL may be blocking all access by devices not specifically permitted by an entry in an ACL affecting those sources. If you are using the ACL to block specific hosts, a group of hosts, or a subnet, but want to allow any access not specifically permitted, insert permit any as the last explicit entry in the ACL.

The switch is not performing routing functions on a VLAN

Two possible causes of this problem are:

- Routing is not enabled. If show running indicates that routing is not enabled, use the ip routing command to enable routing.
- An ACL may be blocking access to the VLAN (on a switch covered in this guide). Ensure that the switch’s IP address on the VLAN is not blocked by one of the ACE entries in an ACL applied to that VLAN. A common mistake is to either not explicitly permit the switch’s IP address as a DA or to use a wildcard ACL mask in a deny statement that happens to include the switch’s IP address. For an Example: of this problem, see section "General ACL Operating Notes" in the "Access Control Lists (ACLs)" of the latest access security guide for your switch.

Routing through a gateway on the switch fails

Configuring a "deny" ACE that includes a gateway address can block traffic attempting to use the gateway as a next-hop.

Remote gateway case

Configuring ACL "101" (example below) and applying it outbound on VLAN 1 in the figure below includes the router gateway (10.0.8.1) needed by devices on other networks. This can prevent the switch from sending ARP and other routing messages to the gateway router to support traffic from authorized remote networks.

In Figure 80: Inadvertently blocking a gateway on page 449, this ACE (see data in bold below) denies access to the 10 Net’s 10.0.8.1 router gateway needed by the 20 Net (Subnet mask is 255.255.255.0). See: example

Figure 80: Inadvertently blocking a gateway

To avoid inadvertently blocking the remote gateway for authorized traffic from another network (such as the 20 Net in this Example:)

To avoid inadvertently blocking the remote gateway for authorized traffic from another network (such as the 20 Net in this Example:):
Procedure
1. Configure an ACE that specifically permits authorized traffic from the remote network.
2. Configure narrowly defined ACEs to block unwanted IP traffic that would otherwise use the gateway; such ACEs might deny traffic for a particular application, particular hosts, or an entire subnet.
3. Configure a "permit any" ACE to specifically allow any IP traffic to move through the gateway.

ACE blocking an entire subnet

```
switch(config)# access-list config
ip access-list extended "101"
    deny ip 0.0.0.0 255.255.255.255 10.0.8.30 0.0.0.255
    permit ip 0.0.0.0 255.255.255.255 0.0.0.00 255.255.255.255
exit
```

Local gateway case
If you use the switch as a gateway for traffic you want routed between subnets, use these general steps to avoid blocking the gateway for authorized applications:

Procedure
1. Configure gateway security first for routing with specific permit and deny statements.
2. Permit authorized traffic.
3. Deny any unauthorized traffic that you have not already denied in step 1.

IGMP-related problems

IP multicast (IGMP) traffic that is directed by IGMP does not reach IGMP hosts or a multicast router connected to a port
IGMP must be enabled on the switch and the affected port must be configured for "Auto" or "Forward" operation.

IP multicast traffic floods out all ports; IGMP does not appear to filter traffic
The IGMP feature does not operate if the switch or VLAN does not have an IP address configured manually or obtained through DHCP/Bootp. To verify whether an IP address is configured for the switch or VLAN, do one of the following:

- **Try using the WebAgent**: If you can access the WebAgent, then an IP address is configured.
- **Try to telnet to the switch console**: If you can Telnet to the switch, an IP address is configured.
- **Use the switch console interface**: From the Main Menu, check the Management Address Information screen by clicking on:
  1. Status and Counters
  2. Switch Management Address Information

LACP-related problems
Unable to enable LACP on a port with the `interface <port-number> lacp` command

In this case, the switch displays the following message:

*Operation is not allowed for a trunked port.*

You cannot enable LACP on a port while it is configured as a static Trunk port. To enable LACP on a static-trunked port:

**Procedure**

1. Use the `no trunk <port-number>` command to disable the static trunk assignment.
2. Execute `interface <port-number> lacp`.

---

**CAUTION:** Removing a port from a trunk without first disabling the port can create a traffic loop that can slow down or halt your network. Before removing a port from a trunk, Hewlett Packard Enterprise recommends that you either disable the port or disconnect it from the LAN.

---

**Port-based access control (802.1X)-related problems**

**NOTE:**

To list the 802.1X port-access Event Log messages stored on the switch, use `show log 802`.

See also [Radius-related problems](#) on page 453.

**The switch does not receive a response to RADIUS authentication requests**

In this case, the switch attempts authentication using the secondary method configured for the type of access you are using (console, Telnet, or SSH).

There can be several reasons for not receiving a response to an authentication request. Do the following:

- Use `ping` to ensure that the switch has access to the configured RADIUS servers.
- Verify that the switch is using the correct encryption key (RADIUS secret key) for each server.
- Verify that the switch has the correct IP address for each RADIUS server.
- Ensure that the `radius-server timeout` period is long enough for network conditions.

**The switch does not authenticate a client even though the RADIUS server is properly configured and providing a response to the authentication request**

If the RADIUS server configuration for authenticating the client includes a VLAN assignment, ensure that the VLAN exists as a static VLAN on the switch. See "How 802.1X Authentication Affects VLAN Operation" in the access security guide for your switch.

**During RADIUS-authenticated client sessions, access to a VLAN on the port used for the client sessions is lost**

If the affected VLAN is configured as untagged on the port, it may be temporarily blocked on that port during an 802.1X session. This is because the switch has temporarily assigned another VLAN as untagged on the port to support the client access, as specified in the response from the RADIUS server. See "How 802.1X Authentication Affects VLAN Operation" in the access security guide for your switch.
The switch appears to be properly configured as a supplicant, but cannot gain access to the intended authenticator port on the switch to which it is connected

If `aaa authentication port-access` is configured for Local, ensure that you have entered the local `login` (operator-level) username and password of the authenticator switch into the `identity` and `secret` parameters of the supplicant configuration. If instead, you enter the enable (manager-level) username and password, access will be denied.

The supplicant statistics listing shows multiple ports with the same authenticator MAC address

The link to the authenticator may have been moved from one port to another without the supplicant statistics having been cleared from the first port. See “Note on Supplicant Statistics” in the chapter on Port-Based and User-Based Access Control in the access security guide for your switch.

The show port-access authenticator `<port-list>` command shows one or more ports remain open after they have been configured with control unauthorized

802.1X is not active on the switch. After you execute `aaa port-access authenticator active`, all ports configured with control unauthorized should be listed as Closed.

**Authenticator ports remain "open" until activated**

```
switch(config)# show port-access authenticator e 9
Port Access Authenticator Status
 Port-access authenticator activated [No] : No
 Access Authenticator Authenticator
 Port Status Control State Backend State
    ---- ------ -------- -------------- --------------
    9    Open 1  FU        Force Auth     Idle
```

Switch(config)# show port-access authenticator active
Switch(config)# show port-access authenticator e 9
Port Access Authenticator Status
 Port-access authenticator activated [No] : Yes
 Access Authenticator Authenticator
 Port Status Control State Backend State
    ---- ------ -------- -------------- --------------
    9    Closed FU    Force Unauth   Idle

1Port A9 shows an “Open” status even though Access Control is set to Unauthorized (Force Auth). This is because the port-access authenticator has not yet been activated.

**RADIUS server fails to respond to a request for service, even though the server's IP address is correctly configured in the switch**

Use `show radius` to verify that the encryption key (RADIUS secret key) the switch is using is correct for the server being contacted. If the switch has only a global key configured, it either must match the server key or you must configure a server-specific key. If the switch already has a server-specific key assigned to the server's IP address, it overrides the global key and must match the server key.

**Displaying encryption keys**

```
switch(config)# show radius
Status and Counters - General RADIUS Information
 Deadtime(min) : 0
 Timeout(secs) : 5
```
Retransmit Attempts : 3
Global Encryption Key : My-Global-Key
Dynamic Authorization UDP Port : 3799

<table>
<thead>
<tr>
<th>Server IP Addr</th>
<th>Auth Acct</th>
<th>DM/ Time</th>
<th>Server IP Addr</th>
<th>Port Port CoA Window Encryption Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.33.18.119</td>
<td>1812 1813</td>
<td>119-only-key</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Also, ensure that the switch port used to access the RADIUS server is not blocked by an 802.1X configuration on that port. For example, `show port-access authenticator <port-list>` gives you the status for the specified ports. Also, ensure that other factors, such as port security or any 802.1X configuration on the RADIUS server are not blocking the link.

The authorized MAC address on a port that is configured for both 802.1X and port security either changes or is re-acquired after execution of `aaa port-access authenticator <port-list> initialize`

If the port is force-authorized with `aaa port-access authenticator <port-list> control authorized` command and port security is enabled on the port, then executing `initialize` causes the port to clear the learned address and learn a new address from the first packet it receives after you execute `initialize`.

A trunked port configured for 802.1X is blocked

If you are using RADIUS authentication and the RADIUS server specifies a VLAN for the port, the switch allows authentication, but blocks the port. To eliminate this problem, either remove the port from the trunk or reconfigure the RADIUS server to avoid specifying a VLAN.

QoS-related problems

Loss of communication when using VLAN-tagged traffic

If you cannot communicate with a device in a tagged VLAN environment, ensure that the device either supports VLAN tagged traffic or is connected to a VLAN port that is configured as Untagged.

Radius-related problems

The switch does not receive a response to RADIUS authentication requests

In this case, the switch attempts authentication using the secondary method configured for the type of access you are using (console, Telnet, or SSH).

There can be several reasons for not receiving a response to an authentication request. Do the following:

- Use `ping` to ensure that the switch has access to the configured RADIUS server.
- Verify that the switch is using the correct encryption key for the designated server.
- Verify that the switch has the correct IP address for the RADIUS server.
- Ensure that the `radius-server timeout` period is long enough for network conditions.
- Verify that the switch is using the same UDP port number as the server.
NOTE: Because of an inconsistency between the Windows XP 802.1x supplicant timeout value and the switch default timeout value, which is 5, when adding a backup RADIUS server, set the switch radius-server timeout value to 4. Otherwise, the switch may not failover properly to the backup RADIUS server.

RADIUS server fails to respond to a request for service, even though the server's IP address is correctly configured in the switch

Use `show radius` to verify that the encryption key the switch is using is correct for the server being contacted. If the switch has only a global key configured, it either must match the server key or you must configure a server-specific key. If the switch already has a server-specific key assigned to the server’s IP address, it overrides the global key and must match the server key.

Global and unique encryption keys

```
Switch(config)# show radius
Status and Counters - General RADIUS Information
  Deadtime(min) : 0
  Timeout(secs) : 5
  Retransmit Attempts : 3
  Global Encryption Key : My-Global-Key
  Dynamic Authorization UDP Port : 3799

  Server IP Addr  Auth Acct DM/ Time Port Port CoA Window Encryption Key
  --------------- ---- ---- --- ------ ---------------
  10.33.18.119    1812 1813            119-only-key

  1
  Global RADIUS Encryption Key

  2
  Unique RADIUS Encryption Key for the RADIUS server at 10.33.18.119
```

MSTP and fast-uplink problems

**CAUTION:**

If you enable MSTP, Hewlett Packard Enterprise recommends that you leave the remainder of the MSTP parameter settings at their default values until you have had an opportunity to evaluate MSTP performance in your network. Because incorrect MSTP settings can adversely affect network performance, you should avoid making changes without having a strong understanding of how MSTP operates. To learn the details of MSTP operation, see the IEEE802.1s standard.

Broadcast storms appearing in the network

This can occur when there are physical loops (redundant links) in the topology. Where this exists, you should enable MSTP on all bridging devices in the topology to detect the loop.

**STP blocks a link in a VLAN even though there are no redundant links in that VLAN**

In 802.1Q-compliant switches, MSTP blocks redundant physical links even if they are in separate VLANs. A solution is to use only one, multiple-VLAN (tagged) link between the devices. Also, if ports are available, you can improve the bandwidth in this situation by using a port trunk. See “Spanning Tree Operation with VLANs” in "Static Virtual LANs (VLANs)" in the advanced traffic management guide for your switch.
Fast-uplink troubleshooting

Some of the problems that can result from incorrect use of fast-uplink MSTP include temporary loops and generation of duplicate packets.

Problem sources can include:

- Fast-uplink is configured on a switch that is the MSTP root device.
- Either the Hello Time or the Max Age setting (or both) is too long on one or more switches. Return the Hello Time and Max Age settings to their default values (2 seconds and 20 seconds, respectively, on a switch).
- A "downlink" port is connected to a switch that is further away (in hop count) from the root device than the switch port on which fast-uplink MSTP is configured.
- Two edge switches are directly linked to each other with a fast-uplink (Mode = Uplink) connection.
- Fast uplink is configured on both ends of a link.
- A switch serving as a backup MSTP root switch has ports configured for fast-uplink MSTP and has become the root device because of a failure in the original root device.

SSH-related problems

Switch access refused to a client

Even though you have placed the client's public key in a text file and copied the file (using the copy tftp pub-key-file command) into the switch, the switch refuses to allow the client to have access. If the source SSH client is an SSHv2 application, the public key may be in the PEM format, which the switch (SSHv1) does not interpret. Check the SSH client application for a utility that can convert the PEM-formatted key into an ASCII-formatted key.

Executing IP SSH does not enable SSH on the switch

The switch does not have a host key. Verify by executing show ip host-public-key. If you see the message

```
ssh cannot be enabled until a host key is configured (use 'crypto' command).
```

you need to generate an SSH key pair for the switch. To do so, execute crypto key generate (see "Generating the switch's public and private key pair" in the SSH chapter of the access security guide for your switch.)

Switch does not detect a client’s public key that does appear in the switch’s public key file (show ip client-public-key)

The client's public key entry in the public key file may be preceded by another entry that does not terminate with a new line (CR). In this case, the switch interprets the next sequential key entry as simply a comment attached to the preceding key entry. Where a public key file has more than one entry, ensure that all entries terminate with a new line (CR). While this is optional for the last entry in the file, not adding a new line to the last entry creates an error potential if you either add another key to the file at a later time or change the order of the keys in the file.

An attempt to copy a client public-key file into the switch has failed and the switch lists one of the following messages

- Download failed: overlength key in key file.
- Download failed: too many keys in key file.
- Download failed: one or more keys is not a valid RSA public key.
The public key file you are trying to download has one of the following problems:

- A key in the file is too long. The maximum key length is 1024 characters, including spaces. This could also mean that two or more keys are merged together instead of being separated by a <CR> <LF>.
- There are more than ten public keys in the key file.
- One or more keys in the file is corrupted or is not a valid rsa public key.

**Client ceases to respond ("hangs") during connection phase**

The switch does not support data compression in an SSH session. Clients often have compression turned on by default, but then disable it during the negotiation phase. A client that does not recognize the compression-request FAILURE response may fail when attempting to connect. Ensure that compression is turned off before attempting a connection to prevent this problem.

**TACACS-related problems**

**Event Log**

When troubleshooting TACACS+ operation, check the switch's Event Log for indications of problem areas.

**All users are locked out of access to the switch**

If the switch is functioning properly, but no username/password pairs result in console or Telnet access to the switch, the problem may be caused by how the TACACS+ server and/or the switch are configured. Use one of the following methods to recover:

- Access the TACACS+ server application and adjust or remove the configuration parameters controlling access to the switch.
- If the above method does not work, try eliminating configuration changes in the switch that have not been saved to flash (boot-up configuration) by causing the switch to reboot from the boot-up configuration (which includes only the configuration changes made prior to the last write memory command.) If you did not use write memory to save the authentication configuration to flash, pressing the Reset button reboots the switch with the boot-up configuration.
- Disconnect the switch from network access to any TACACS+ servers and then log in to the switch using either Telnet or direct console port access. Because the switch cannot access a TACACS+ server, it defaults to local authentication. You can then use the switch's local Operator or Manager username/password pair to log on.
- As a last resort, use the Clear/Reset button combination to reset the switch to its factory default boot-up configuration. Taking this step means you will have to reconfigure the switch to return it to operation in your network.

**No communication between the switch and the TACACS+ server application**

If the switch can access the server device (that is, it can ping the server), a configuration error may be the problem. Some possibilities include:

- The server IP address configured with the switch's tacacs-serverhost command may not be correct. (Use the switch's show tacacs-server command to list the TACACS+ server IP address.)
- The encryption key configured in the server does not match the encryption key configured in the switch (by using the tacacs-server key command). Verify the key in the server and compare it to the key configured
in the switch. (Use `show tacacs-server` to list the global key. Use `show config` or `show config running` to list any server-specific keys.)

- The accessible TACACS+ servers are not configured to provide service to the switch.

### Access is denied even though the username/password pair is correct

Some reasons for denial include the following parameters controlled by your TACACS+ server application:

- The account has expired.
- The access attempt is through a port that is not allowed for the account.
- The time quota for the account has been exhausted.
- The time credit for the account has expired.
- The access attempt is outside of the time frame allowed for the account.
- The allowed number of concurrent logins for the account has been exceeded.

For more help, see the documentation provided with your TACACS+ server application.

### Unknown users allowed to login to the switch

Your TACACS+ application may be configured to allow access to unknown users by assigning them the privileges included in a `default user` profile. See the documentation provided with your TACACS+ server application.

### System allows fewer login attempts than specified in the switch configuration

Your TACACS+ server application may be configured to allow fewer login attempts than you have configured in the switch with the `aaa authentication num-attempts` command.

### TimeP, SNTP, or Gateway problems

#### The switch cannot find the time server or the configured gateway

TimeP, SNTP, and Gateway access are through the primary VLAN, which in the default configuration is the `DEFAULT_VLAN`. If the primary VLAN has been moved to another VLAN, it may be disabled or does not have ports assigned to it.

### VLAN-related problems

#### Monitor port

When using the monitor port in a multiple-VLAN environment, the switch handles broadcast, multicast, and unicast traffic output from the monitor port as follows:

- If the monitor port is configured for tagged VLAN operation on the same VLAN as the traffic from monitored ports, the traffic output from the monitor port carries the same VLAN tag.
- If the monitor port is configured for untagged VLAN operation on the same VLAN as the traffic from the monitored ports, the traffic output from the monitor port is untagged.
- If the monitor port is not a member of the same VLAN as the traffic from the monitored ports, traffic from the monitored ports does not go out the monitor port.
None of the devices assigned to one or more VLANs on an 802.1Q-compliant switch are being recognized

If multiple VLANs are being used on ports connecting 802.1Q-compliant devices, inconsistent VLAN IDs may have been assigned to one or more VLANs. For a given VLAN, the same VLAN ID must be used on all connected 802.1Q-compliant devices.

Link configured for multiple VLANs does not support traffic for one or more VLANs

One or more VLANs may not be properly configured as "Tagged" or "Untagged." A VLAN assigned to a port connecting two 802.1Q-compliant devices must be configured the same on both ports. For example, VLAN_1 and VLAN_2 use the same link between switch "X" and switch "Y," as shown in Figure 81: Example: of correct VLAN port assignments on a link on page 458.

Figure 81: Example: of correct VLAN port assignments on a link

- If VLAN_1 (VID=1) is configured as "Untagged" on port 3 on switch "X," it must also be configured as "Untagged" on port 7 on switch "Y." Make sure that the VLAN ID (VID) is the same on both switches.
- Similarly, if VLAN_2 (VID=2) is configured as "Tagged" on the link port on switch "A," it must also be configured as "Tagged" on the link port on switch "B." Make sure that the VLAN ID (VID) is the same on both switches.

Duplicate MAC addresses across VLANs

The switches operate with multiple forwarding databases. Thus, duplicate MAC addresses occurring on different VLANs can appear where a device having one MAC address is a member of more than one 802.1Q VLAN, and the switch port to which the device is linked is using VLANs (instead of MSTP or trunking) to establish redundant links to another switch. If the other device sends traffic over multiple VLANs, its MAC address consistently appears in multiple VLANs on the switch port to which it is linked.

Be aware that attempting to create redundant paths through the use of VLANs causes problems with some switches. One symptom is that a duplicate MAC address appears in the Port Address Table of one port and then later appears on another port. While the switches have multiple forwarding databases and thus do not have this problem, some switches with a single forwarding database for all VLANs may produce the impression that a connected device is moving among ports because packets with the same MAC address but different VLANs are
received on different ports. You can avoid this problem by creating redundant paths using port trunks or spanning tree.

**Figure 82: Example of duplicate MAC address**

![Diagram](image)

**Disabled overlapping subnet configuration**

Previous software versions allowed configuration of VLAN IP addresses in overlapping subnets which can cause incorrect routing of packets and result in IP communication failure. As of software version WB.15.09, overlapping subnet configurations are no longer allowed. An overlapping subnet is determined by the configuration order. The subnet that is configured first is valid, but any subsequent IP addresses that overlap are not allowed.

When the switch is booted into software version WB.15.09 or later, and the configuration file includes overlapping subnets, the following occurs:

- The event log provides an error message in the format:
  
  
  ip: VLANx : IP initialization failed for vlan x.

  For a multinetted VLAN (multiple IP addresses assigned to the VLAN), only the IP addresses that are overlapping subnets are removed. The other IP addresses on the VLAN are retained and function correctly. The error message can be somewhat misleading; the IP addresses on the VLAN that are not overlapping are initialized correctly.

- The output of the show ip command correctly indicates that the overlapping IP address does not exist on the VLANs that have error messages in the event log.

- The output of the show running-config command incorrectly indicates that the overlapping IP address is configured. In **Figure 83: An IP address that is not actually configured on the VLAN** on page 459, the IP address shown in VLAN6 is not actually configured on the VLAN; it has been removed.

**Figure 83: An IP address that is not actually configured on the VLAN**

```bash
switch(config)# show running-config

  .
  .
  .

  vlan 5
   name “VLAN5”
   ip address 11.22.33.1 255.0.0.0
   exit
  vlan 6
   name “VLAN6”
   ip address 11.23.34.1 255.255.255.0
   exit
```

Chapter 13 Troubleshooting
The information is retained in the config file to allow you to boot up the switch and have it function as it did when it was configured with earlier software that allows overlapping subnets. If you attempt to remove the overlapping subnet from the VLAN, the switch displays an error message similar to:

The IP address <ip-address> is not configured on this VLAN

This occurs because the overlapping IP address has been removed and is not visible to the switch. To resolve this:

• Enter the `show ip` command to determine which addresses are visible to the switch.
• Remove the erroneous IP addresses from the config file by entering the `no ip address` command to remove all the IP addresses from the specific VLAN. Be sure to document the other valid IP addresses on that VLAN so they can be restored after removing the erroneous IP addresses from the config file.

If you go back to a software version prior to WB.15.09 before removing the overlapping IP address, the prior software version enables the overlapping IP subnet.

**Fan failure**

Whenever a fan failure occurs, the Fan/Fault LEDs blink amber and a log entry is recorded. During a fan failure, all operational fans are automatically set to the maximum operating speed until the fan failure has been resolved. At that time, the fan speed is reset to the minimum operating speed.

**Mitigating flapping transceivers**

In traditional switches, the state of a link is driven directly by the reported state of the port, which is required for rapid detection of link faults. However, the consequence of this is that a marginal transceiver, optical, or wire cabling, one that "flaps" up and down several times per second, can cause STP and other protocols to react poorly, resulting in a network outage. The link-flap option expands the functionality of the existing fault finder function to include a "link-flap" event and a new action of "warn-and-disable." Together, these additions allow the errant condition to be detected, and the port in question can be optionally disabled.

**Syntax:**

```
fault-finder <link-flap> sensitivity {<low | medium | high} > action {<warn | warn-and-disable>}
```

Default settings: Sensitivity = Medium; Action = Warn

Sensitivity thresholds are static. In a 10-second window, if more than the threshold number of link state transitions (up or down) are detected, the event is triggered. The 10-second window is statically determined, that is, the counters are reset every 10 seconds, as opposed to being a sliding window. The counters are polled twice per second (every 500 milliseconds), and the event is triggered if the sensitivity threshold is crossed at that time.

The sensitivity thresholds are:

<table>
<thead>
<tr>
<th>Sensitivity</th>
<th>Transitions in 10 seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
<td>3</td>
</tr>
<tr>
<td>Medium</td>
<td>6</td>
</tr>
<tr>
<td>Low</td>
<td>10</td>
</tr>
</tbody>
</table>

Configuring the link-flap event and corresponding action applies to all ports and port types (it is a global setting per FFI event type). Note that normal link transition protocols may prevent link state changes from occurring fast enough to trigger the event for some port types, configurations, and sensitivity settings.
When the link-flap threshold is met for a port configured for warn (For example, fault-finder link-flap sensitivity medium action warn), the following message is seen in the switch event log.

02672 FFI: port <number>-Excessive link state transitions

When the link-flap threshold is met for a port configured for warn-and-disable (For example, fault-finder linkflap sensitivity medium action warn-and-disable), the following messages are seen in the switch event log.

02672 FFI: port <number>-Excessive link state transitions
02673 FFI: port <number>-Port disabled by Fault-finder.
02674 FFI: port <number>-Administrator action required to re-enable.

The warn-and-disable action is available for all fault-finder events on an individual basis. It may be used, for example, to disable a port when excessive broadcasts are received. Because the fault-generated disabling of a port requires operator intervention to re-enable the port, such configuration should be used with care. For example, link-flap-initiated disablement is not desired on ports that are at the client edge of the network, because link state changes there are frequent and expected.

Hewlett Packard Enterprise does not recommend automatic disabling of a port at the core or distribution layers when excessive broadcasts are detected, because of the potential to disable large parts of the network that may be uninvolved and for the opportunity to create a denial-of-service attack.

**Fault-finder link-flap**

**Syntax**

In the config context:

```plaintext
```

**Description**

Configures the link-flap on a port. The default value is warn.

**Options**

**link-flap**

Configure link-flap control.

**warn**

Log the event only.

**warn-and-disable**

Log the event and disable the port.

**seconds**

Re-enable the port after waiting for the specified number of seconds. The default value is 0, which indicates that the port will not be automatically enabled.

**sensitivity**

Indicate the sensitivity of the link-flap control threshold within a 10-second interval.

- Low indicates 10 link-flaps.
- Medium indicates 6 link-flaps.
- High indicates 3 link-flaps.

**Parameters**
**action**
Configure the action taken when a fault is detected.

**ethernet PORT-LIST**
Enable link-flap control on a list of ports.

**warn**
Warn about faults found.

**warn-and-disable**
Warn and disable faulty component.

**seconds**
Configure the number of seconds for which the port remains disabled. A value of 0 means that the port will remain disabled until manually re-enabled.

**sensitivity**
Configure the fault sensitivity level.

**low**
Low sensitivity.

**medium**
Medium sensitivity

**high**
High sensitivity.

**Subcommand Syntax**

```
[no] fault-finder link-flap ethernet PORT-LIST
```

**Description**
To remove the current configuration of link-flap on a port

**Usage**
Enable a linkFault-Finder check and set parameters for it. These commands may be repeated to enable additional checks. The default sensitivity is medium and the default action is warn.

```
[no] fault-finder all | fault sensitivity low | medium | high action warn | warn-and-disable
[no] fault-finder link-flap sensitivity low | medium | high action warn | warn-and-disable
[no] fault-finder link-flap PORT-LIST action warn | warn-and-disable SECONDS sensitivity low | medium | high
```

**Configure ports for link-flap detection with high sensitivity**
Configure ports A1 to A5 for link-flap detection with sensitivity of high (3 flaps over 10s) and to log and disable port for 65535s if the link-flap threshold is exceeded.

```
switch(config)# fault-finder link-flap ethernet A1-A5 action warn-and-disable 65535 sensitivity high
```
Configure ports for link-flap detection with medium sensitivity

Configure ports A8 for link-flap detection with sensitivity of medium (6 flaps over 10s) and to log and disable port if the link-flap threshold is exceeded. User will need to re-enable the port if disabled.

switch(config)# fault-finder link-flap ethernet A8 action warn-and-disable 0 sensitivity medium

Configure ports for link-flap detection with low sensitivity

Configure ports A22 for link-flap detection with sensitivity of low (10 flaps over 10s) and to log if the link-flap threshold is exceeded

switch(config)# fault-finder link-flap ethernet A22 action warn sensitivity low

Disable link-flap detection

Disable link-flap detection for port A5

switch(config)# no fault-finder link-flap ethernet A5

Show fault-finder link-flap

Syntax

show fault-finder link-flap ethernet PORT-LIST

Description

Display the link-flap control configuration.

Show fault-finder link-flap

switch# show fault-finder link-flap A1

<table>
<thead>
<tr>
<th>Port</th>
<th>Flap</th>
<th>Status</th>

</table>

¹ Support indicators:
- V - Validated to respond to DOM requests
- N - No support of DOM
- D - Documented by the component suppliers as supporting DOM
- NA - Not applicable to the transceiver (copper transceiver)
NOTE: Not all transceivers support Digital Optical Monitoring. If DOM appears in the Diagnostic Support field of the `show interfaces transceiver detail` command, or the `hpicfTransceiverMIB hpicfXcvrDiagnostics MIB` object, DOM is supported for that transceiver.

### Viewing information about transceivers (CLI)

**Syntax:**

```
show interfaces transceiver [port-list] [detail]
```

Displays information about the transceivers. If a port is specified, displays information for the transceiver in that port.

<table>
<thead>
<tr>
<th>[detail]</th>
<th>Displays detailed transceiver information.</th>
</tr>
</thead>
</table>

### MIB support

The `hpicfTransceiver MIB` is available for displaying transceiver information.

### Viewing transceiver information

The transceiver information displayed depends on the `show` command executed.

The **output for `show interfaces transceiver [port-list]`** is shown below. You can specify multiple ports, separated by commas, and the information for each transceiver will display.

#### Output for a specified transceiver

```
switch(config)# show interfaces transceiver 21
```

Transceiver Technical information:

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Product</th>
<th>Serial</th>
<th>Part</th>
</tr>
</thead>
<tbody>
<tr>
<td>21</td>
<td>1000SX</td>
<td>J4858C</td>
<td>MY050VM9WB</td>
<td>1990-3657</td>
</tr>
</tbody>
</table>

If there is no transceiver in the port specified in the command, the output displays as shown below.

#### Output when no transceiver is present in specified interface

```
switch(config)# show interfaces transceiver 22
```

No Transceiver found on interface 22

When no ports are specified, information for all transceivers found is displayed.

#### Output when no ports are specified

```
switch(config)# show interfaces transceiver
```

Transceiver Technical information:

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Product</th>
<th>Serial</th>
<th>Part</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
You can specify all for port-list as shown below.

### Output when “all” is specified

```bash
switch(config)# show interfaces transceiver all

No Transceiver found on interface 1
No Transceiver found on interface 2
.
.
No Transceiver found on interface 24

Transceiver Technical information:

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Product Number</th>
<th>Serial Number</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>21</td>
<td>1000SX</td>
<td>J4858C</td>
<td>MY050VM9WB</td>
<td>1990-3657</td>
</tr>
<tr>
<td>22</td>
<td>1000SX</td>
<td>J4858B</td>
<td>P834DIP2</td>
<td></td>
</tr>
</tbody>
</table>
```

### Information displayed with the detail parameter

When the `show interfaces transceiver [port-list] detail` command is executed, the following information displays.

#### Table 30: General transceiver information

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Index</td>
<td>The switch interface number</td>
</tr>
<tr>
<td>Transceiver-type</td>
<td>Pluggable transceiver type</td>

An Example: of the output for the show interfaces transceiver [port-list] detail for a 1000SX transceiver is shown below.

## Detailed information for a 1000SX Mini-GBIC transceiver

```
switch(config)# show interfaces transceiver 21 detail

Transceiver in 21
  Interface index : 21
  Type             : 1000SX
  Model            : J4858C
  Connector type   : LC
  Wavelength       : 850nm
  Transfer distance: 300m (50um), 150m (62.5um),
  Diagnostic support: DOM
  Serial number    : MY050VM9WB

Status
  Temperature : 50.111C
  Voltage     : 3.1234V
  TX Bias     : 6mA
  TX Power    : 0.2650mW, -5.768dBm
  RX Power    : 0.3892mW, -4.098dBm

An Example: of the output for a 10GbE-LR transceiver is shown below.

## Detailed information for a 10GbE-LR transceiver

```
switch(config)# show interfaces transceiver 23 detail

Transceiver in 23
  Interface Index  : 24
  Type             : 10GbE-LR
  Model            : J8437A
  Connector type   : SC
  Wavelength       : Channel #0: 1310nm, #1:0nm, #2:0nm, #3:0nm
  Transfer distance: 10000m (SM)
  Diagnostic support: DOM
  Serial number    : ED456SS987

Status
  Temperature : 32.754C
  TX Bias     : 42.700mA
  TX Power    : 0.5192mW, -2.847dBm
  RX Power    : 0.0040mW, -23.979dBm

Recent Alarms:
Rx power low alarm
Rx power low warning

Recent errors:
Receive optical power fault
PMA/PMD receiver local fault
PMA/PMD transmitter local fault
PCS receive local fault
PHY XS transmit local fault

Time stamp : Mon Mar 7 16:26:06 2013

Viewing transceiver information for copper transceivers with VCT support

This feature provides the ability to view diagnostic monitoring information for copper transceivers with Virtual Cable Test (VCT) support. The cable quality of the copper cables connected between transceivers can be ascertained using the transceiver cable diagnostics. Results of the diagnostics are displayed with the appropriate CLI show commands and with SNMP using the hpicfTransceiver MIB.

The J8177C 1000Base-T Mini-GBIC is supported.

Testing the Cable

Enter the `test cable-diagnostics` command in any context to begin cable diagnostics for the transceiver. The diagnostic attempts to identify cable faults. The tests may take a few seconds to complete for each interface. There is the potential of link loss during the diagnostic.

Syntax:

test cable-diagnostics [port-list]

Invokes cable diagnostics and displays the results.

Output from test cable-diagnostics command

Switch # test cable-diagnostics a23-a24

The `test cable-diagnostics` command will cause a loss of link and will take a few seconds per interface to complete.

Continue (Y/N)? y

### Viewing transceiver information

This feature provides the ability to view diagnostic monitoring information for transceivers with Diagnostic Optical Monitoring (DOM) support. The following table indicates the support level for specific transceivers:

<table>
<thead>
<tr>
<th>Product #</th>
<th>Description</th>

</tr>
</tbody>
</table>

1 Support indicators:
- V - Validated to respond to DOM requests
- N - No support of DOM
- D - Documented by the component suppliers as supporting DOM
- NA - Not applicable to the transceiver (copper transceiver)

**NOTE:** Not all transceivers support Digital Optical Monitoring. If DOM appears in the Diagnostic Support field of the `show interfaces transceiver detail` command, or the `hpifTransceiverMIB hpifXcvrDiagnostics MIB` object, DOM is supported for that transceiver.

### Using the Event Log for troubleshooting switch problems

The Event Log records operating events in single- or double-line entries and serves as a tool to isolate and troubleshoot problems.

Once the log has received 2000 entries, it discards the oldest message each time a new message is received. The Event Log window contains 14 log entry lines. You can scroll through it to view any part of the log.

**NOTE:**
The Event Log is **erased** if power to the switch is interrupted or if you enter the `boot system` command. The contents of the Event Log are **not** erased if you:

- Reboot the switch by choosing the **Reboot Switch** option from the menu interface.
- Enter the `reload` command from the CLI.
Event Log entries

As shown in Figure 84: Format of an event log entry on page 475, each Event Log entry is composed of six or seven fields, depending on whether numbering is turned on or not:

Figure 84: Format of an event log entry

### System module

<table>
<thead>
<tr>
<th>System module</th>
<th>Description</th>
<th>Documented in Switch hardware/software guide</th>
</tr>
</thead>
</table>
| **vlan**      | Static 802.1Q VLAN operations, including port-and protocol-based configurations that group users by logical function instead of physical location  
- A port-based VLAN creates a layer-2 broadcast domain comprising member ports that bridge IPv4 traffic among themselves.  
- A protocol-based VLAN creates a layer-3 broadcast domain for traffic of a particular routing protocol, and comprises member ports that bridge traffic of the specified protocol type among themselves.  
VLAN messages include events from management interfaces (menu and CLI) used to reconfigure the switch and monitor switch status and performance. | *Advanced Traffic Management Guide* |
| **xmodem**    | Xmodem: Binary transfer feature that supports the download of software files from a PC or UNIX workstation. | *Basic Operation Guide* |

### Using the CLI

**Syntax:**

```
show logging [-a, -b, -r, -s, -t, -m, -e, -p, -w, -i, -d, command, filter] [<option-str>]
```

By default, the `show logging` command displays the log messages recorded since the last reboot in chronological order:

- `-a` Displays all recorded log messages, including those before the last reboot.
- `-b` Displays log events as the time since the last reboot instead of in a date/time format.
- `-r` Displays all recorded log messages, with themost recent entries listed first (reverse order).
- `-s` Displays the active management module (AM) and standby management module (SM) log events.
- `-t` Displays the log events with a granularity of 10 milliseconds.

*Table Continued*
<table>
<thead>
<tr>
<th>option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-m</td>
<td>Displays only major log events.</td>
</tr>
<tr>
<td>-e</td>
<td>Displays only error event class.</td>
</tr>
<tr>
<td>-p</td>
<td>Displays only performance log events.</td>
</tr>
<tr>
<td>-w</td>
<td>Displays only warning log events.</td>
</tr>
<tr>
<td>-i</td>
<td>Displays only informational log events.</td>
</tr>
<tr>
<td>-d</td>
<td>Displays only debug log events.</td>
</tr>
<tr>
<td>command</td>
<td>Displays only command logs.</td>
</tr>
<tr>
<td>filter</td>
<td>Displays only log filter configuration and status information.</td>
</tr>
<tr>
<td>&lt;option-str&gt;</td>
<td>Displays all Event Log entries that contain the specified text. Use an &lt;option-str&gt; value with -a or -r to further filter show logging command output.</td>
</tr>
</tbody>
</table>

Example:
To display all Event Log messages that have "system" in the message text or module name, enter the following command:

```
switch# show logging -a system
```

To display all Event Log messages recorded since the last reboot that have the word "system" in the message text or module name, enter:

```
switch# show logging system
```

## Clearing Event Log entries

**Syntax:**

```
clear logging [command]
```

Removes all entries from the event log display output.

Use the `clear logging` command to hide, but not erase, Event Log entries displayed in `show logging` command output. Only new entries generated after you enter the command will be displayed.

To redisplay all hidden entries, including Event Log entries recorded prior to the last reboot, enter the `show logging -a` command.

The `command` option removes all entries from the command log.

## Turning event numbering on

**Syntax:**

```
[no] log-numbers
```

Turns event numbering on and off.
Using log throttling to reduce duplicate Event Log and SNMP messages

A recurring event can generate a series of duplicate Event Log messages and SNMP traps in a relatively short time. As a result, the Event Log and any configured SNMP trap receivers may be flooded with excessive, exactly identical messages. To help reduce this problem, the switch uses **log throttle periods** to regulate (throttle) duplicate messages for recurring events, and maintains a counter to record how many times it detects duplicates of a particular event since the last system reboot.

When the first instance of a particular event or condition generates a message, the switch initiates a log throttle period that applies to all recurrences of that event. If the logged event recurs during the log throttle period, the switch increments the counter initiated by the first instance of the event, but does not generate a new message.

If the logged event repeats again after the log throttle period expires, the switch generates a duplicate of the first message, increments the counter, and starts a new log throttle period during which any additional instances of the event are counted, but not logged. Thus, for a particular recurring event, the switch displays only one message in the Event Log for each log throttle period in which the event reoccurs. Also, each logged instance of the event message includes counter data showing how many times the event has occurred since the last reboot. The switch manages messages to SNMP trap receivers in the same way.

**Log throttle periods**

The length of the log throttle period differs according to an event's severity level:

<table>
<thead>
<tr>
<th>Severity level</th>
<th>Log throttle period</th>
</tr>
</thead>
<tbody>
<tr>
<td>I (Information)</td>
<td>6000 Seconds</td>
</tr>
<tr>
<td>W (Warning)</td>
<td>600 Seconds</td>
</tr>
<tr>
<td>D (Debug)</td>
<td>60 Seconds</td>
</tr>
<tr>
<td>M (Major)</td>
<td>6 Seconds</td>
</tr>
</tbody>
</table>

**Example:**

Suppose that you configure VLAN 100 on the switch to support PIM operation, but do not configure an IP address. If PIM attempts to use VLAN 100, the switch generates the first instance of the following Event Log message and counter.

```
W 10/01/12 09:00:33 PIM:No IP address configured on VID 100 (1)
```

**NOTE:**

In the first instance of an event message and counter on page 488 the counter (1) indicates that this is the first instance of this event since the switch last rebooted.

**The first instance of an event message and counter**

```
W 10/01/12 09:00:33 PIM:No IP address configured on VID 100 (1)
```
If PIM operation causes the same event to occur six more times during the initial log throttle period, there are no further entries in the Event Log. However, if the event occurs again after the log throttle period has expired, the switch repeats the message (with an updated counter) and starts a new log throttle period.

**Figure 85:** Duplicate messages over multiple log throttling periods

Note that if the same type of event occurs under different circumstances, the switch handles these as unrelated events for the purpose of Event Log messages. For example, if PIM operation simultaneously detects that VLANs 100 and 205 are configured without IP addresses, you see log messages similar to the following:

**Figure 86:** Example of log messages generated by unrelated events of the same type

---

**Example: of event counter operation**

Suppose the switch detects the following after a reboot:

- Three duplicate instances of the PIM “Send error” during the first log throttle period for this event
- Five more instances of the same Send error during the second log throttle period for this event
- Four instances of the same Send error during the third log throttle period for this event

In this case, the duplicate message appears three times in the Event Log (once for each log throttle period for the event being described), and the duplicate message counter increments as shown in the following table. (The same operation applies for messages sent to any configured SNMP trap receivers.)

**Table 35:** How the duplicate message counter increments

<table>
<thead>
<tr>
<th>Instances during 1st log throttle period</th>
<th>Instances during 2nd log throttle period</th>
<th>Instances during 3rd log throttle period</th>
<th>Duplicate message counter</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td></td>
<td></td>
<td>1</td>
</tr>

<td>4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4</td>
<td>9</td>
</tr>
</tbody>
</table>
Reporting information about changes to the running configuration

Syslog can be used for sending notifications to a remote syslog server about changes made to the running configuration. The notifications in the syslog messages are sent in ASCII format and contain this information:

- **Notice-Type**: Describes the syslog notification as a "running config change".
- **Event-ID**: Identifier for the running config change event that occurred on the switch.
- **Config-Method**: The source for the running config change.
- **Device-Name**: The managed device.
- **User-Name**: User who made the running config change.
- **Remote-IP-Address**: IP address of a remote host from which the user is connected.

**Syntax:**

```
[no] logging notify <running-config-change> [transmission-interval <0-4294967295>]
```

Enables sending the running configuration change notifications to the syslog server.

The `no` form of the command disables sending the running configuration changes to the syslog server.

Default: Disabled

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;running-config-change&gt;</code></td>
<td>Mandatory option for the notify parameter. Specifies the type of notification to send.</td>
</tr>
<tr>
<td><code>transmission-interval</code></td>
<td>Specifies the time interval (in seconds) between the transmission of two consecutive notifications. Running config changes occurring within the specified interval will not generate syslog notifications.</td>
</tr>
</tbody>
</table>

A value of zero means there is no limit; a notification is sent for every running config change.

Default: Zero

Sending running config changes to the syslog server

```
switch(config)# logging notify running-config-change
transmission-interval 10
```

**Debug/syslog operation**

While the Event Log records switch-level progress, status, and warning messages on the switch, the debug/syslog logging feature provides a way to record Event Log and debug messages on a remote device. For example, you can send messages about routing misconfigurations and other network protocol details to an external device, and later use them to debug network-level problems.

**Debug/syslog messaging**

The debug/syslog feature allows you to specify the types of Event Log and debug messages that you want to send to an external device. You can perform the following operations:
• Use the `debug` command to configure messaging reports for the following event types:
  ◦ ACL "deny" matches
  ◦ Dynamic ARP protection events
  ◦ DHCP snooping events
  ◦ DIPLD events
  ◦ Events recorded in the switch's Event Log
  ◦ IP routing events (IPv4 and IPv6)
  ◦ LACP events
  ◦ LLDP events
  ◦ SNMP events
  ◦ SSH events

• Use the `logging` command to select a subset of Event Log messages to send to an external device for debugging purposes according to:
  ◦ Severity level
  ◦ System module

**Hostname in syslog messages**

The syslog now messages the sender identified by hostname.

The hostname field identifies the switch that originally sends the syslog message. Configurable through the CLI and SNMP, the format of the hostname field supports the following formats:

• `ip-address`: The IP address of the sending interface will be used as the message origin identifier. This is the default format for the origin identifier. The IP address of the sending interface (in dotted decimal notation) is the default format.

• `hostname`: The hostname of the sending switch will be used as the message origin identifier.

• `none`: No origin identifier will be embedded in the syslog message. Nilvalue is used as defined by "-".

This configuration is system-wide, not per syslog server. There is no support for fully-qualified domain name.

**Logging origin-id**

Use the `logging origin-id` command to specify the content for the hostname field.

**Syntax:**

```
logging origin-id [ip-address|hostname|none]
```

```
[no] logging origin-id [ip-address|hostname|none]
```

To reset the hostname field content back to default (IP-address), use the `no` form of the command.

**filter**

Creates a filter to restrict which events are logged.
IP-ADDR
Adds an IPv4 address to the list of receiving syslog servers.

IPV6-ADDR
Adds an IPv6 address to the list of receiving syslog servers.

origin-id
Sends the Syslog messages with the specified origin-id.

notify
Notifies the specified type sent to the syslog server(s).

duration-descr
A text string associated with the values of facility, severity, and system-module.

severity
Event messages of the specified severity or higher sent to the syslog server.

system-module
Event messages of the specified system module (subsystem) sent to the syslog server.

hostname
Sets the hostname of the device as the origin-id.

none
Disables origin-id in the syslog message.

Add an IP address to the list of receiving syslog servers.

Use of no without an IP address specified will remove all IP addresses from the list of syslog receivers. If an IP address is specified, that receiver will be removed. Both link-local with zone ID and global IPv6 addresses are supported.

- Specify syslog server facility with the option <facility>. The command no logging <facility> sets the facility back to defaults.
- Specify filtering rules.
- Specify severity for event messages to be filtered to the syslog server with the option <severity>. The command no logging <severity> sets the severity back to default.
- Event messages of specified system module will be sent to the syslog server. Using no sends messages from all system modules. Messages are first filtered by selected severity.
- Specify syslog server transport layer with options [udp]||[tcp]||[tls].
- Specify syslog server port number with options [udp PORT-NUM]||[tcp PORT-NUM]||[tls PORT-NUM].
- Specify notification types to be sent to the syslog server.
- Use the option transmission-interval to control the egress rate limit for transmitting notifications, 0 value means there is no rate limit. The values are in seconds. Only one syslog message is allowed for transmission within specified time interval.
- Specify the origin information for the syslog messages with the option origin-id.
NOTE: When the syslog server receives messages from the switch, the IPv6 address of the switch is partly displayed.

Example:

Configured Host Ipv6 Address: 2001::1

Expected Syslog message:

Syslog message: USER.INFO: Oct 11 02:40:02 2001::1 00025 ip:
ST1CMDR: VLAN60: ip address 30.1.1.1/24 configured on vlan 60

Actual Truncated syslog message:

Syslog message: USER.INFO: Oct 11 02:40:02 2001:: 00025 ip: ST1CMDR:
VLAN60: ip address 30.1.1.1/24 configured on vlan 60

Use the command in the following example to set the origin-id to the hostname.

Setting the origin-id to the hostname

```
switch(config)# logging origin-id hostname
```

The following syslog message will occur:

```
<14> Jan 1 00:15:35 2910al-24G 00076 ports: port 2 is now on-line
```

Use the command in the following example to set the origin-id to none (nilvalue).

Setting the origin-id to none (nilvalue)

```
switch(config)# logging origin-id none
```

The following syslog message will occur:

```
<14> Jan 1 00:15:35 - 00076 ports: port 2 is now on-line
```

Use any of the commands in the following example to set the origin-id to ip-address (default).

Setting the origin-id to ip-address (default)

```
switch(config)# logging origin-id ip-address
switch(config)# no logging origin-id hostname
switch(config)# no logging origin-id none
```

The following syslog message will occur:

```
<14> Jan 1 00:15:35 169.254.230.236 00076 ports: port 2 is now on-line
```

**Viewing the identification of the syslog message sender**

Use the commands `show debug` or `show running-config` to display the identification of the syslog message sender. The default option for `origin-id` is `ip-address`. The command `show running-config` will not display the configured option when `origin-id` is set to the default value of `ip address`.

When `hostname` or `none` is configured using `logging origin-id`, the same displays as part of the `show running-config` command.
Syntax:

```plaintext
show debug
```

Default option is `ip-address`.

The following shows the output of the `show debug` command when configured without `loggin origin-id`.

### Output of the show debug command when configured without login origin-id

<table>
<thead>
<tr>
<th>Debug Logging</th>
<th>Destination: None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin identifier: Outgoing Interface IP</td>
<td></td>
</tr>
<tr>
<td>Enabled debug types:</td>
<td>None are enabled.</td>
</tr>
</tbody>
</table>

The command `logging origin-id hostname` will produce the syslog message shown in the following example.

### Syslog message for logging origin-id hostname

<table>
<thead>
<tr>
<th>Debug Logging</th>
<th>Destination: None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin identifier: Hostname</td>
<td></td>
</tr>
<tr>
<td>Enabled debug types:</td>
<td>None are enabled.</td>
</tr>
</tbody>
</table>

The command `logging origin-id none` will produce the syslog message shown in the following example.

### Syslog message for logging origin-id none

<table>
<thead>
<tr>
<th>Debug Logging</th>
<th>Destination: None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin identifier: none</td>
<td></td>
</tr>
<tr>
<td>Enabled debug types:</td>
<td>None are enabled.</td>
</tr>
</tbody>
</table>

Syntax:

```plaintext
show running-config
```

The following example shows the output of the `show running-config` command.

### Output of the show running-config command

The command `logging origin-id hostname` will display the following:

```plaintext
logging origin-id hostname
```

The command `logging origin-id none` will display as the following:

```plaintext
logging origin-id none
```
SNMP MIB

SNMP support will be provided through the following MIB objects.

**HpicfSyslogOriginId = textual-convention**

**Description**

This textual convention enumerates the origin identifier of syslog message.

**Syntax:** integer
- ip-address
- hostname
- none

**Status**
- current

**HpicfSyslogOriginId OBJECT-TYPE**

**Description**

Specifies the content of a Hostname field in the header of a syslog message.

**Syntax:**

- **HpicfSyslogOriginId**
- Max-access: read-write

**Status**
- current

**Default**
- ip-address

---

**Debug/syslog destination devices**

To use debug/syslog messaging, you must configure an external device as the logging destination by using the `logging` and `debug destination` commands. For more information, see [Debug destinations](#) on page 505 and [Configuring a syslog server](#) on page 507.

A debug/syslog destination device can be a syslog server and/or a console session. You can configure debug and logging messages to be sent to:

- Up to six syslog servers
- A CLI session through a direct RS-232 console connection, or a Telnet or SSH session
### Debug/syslog configuration commands

<table>
<thead>
<tr>
<th>Event notification logging</th>
<th>—</th>
<th>Automatically sends switch-level event messages to the switch's Event Log. Debug and syslog do not affect this operation, but add the capability of directing Event Log messaging to an external device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging command</td>
<td><code>&lt;syslog-ip-addr&gt;</code></td>
<td>Enables syslog messaging to be sent to the specified IP address. IPv4 and IPv6 are supported.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

### Using the Debug/Syslog Feature

- Configure the switch to send Event Log messages to one or more Syslog servers. In addition, you can configure the messages to be sent to the User log facility (default) or to another log facility on configured Syslog servers.
- Configure the switch to send Event Log messages to the current management access session (serial-connect CLI, Telnet CLI, or SSH).
- Disable all Syslog debug logging while retaining the Syslog addresses from the switch configuration. This allows you to configure Syslog messaging and then disable and re-enable it as needed.
- Display the current debug configuration. If Syslog logging is currently active, the list of configured Syslog servers is displayed.
- Display the current Syslog server list when Syslog logging is disabled.

### Configuring debug/syslog Operation

**Procedure**

1. To use a syslog server as the destination device for debug messaging, follow these steps:
a. Enter the `logging <syslog-ip-addr>` command at the global configuration level to configure the syslog server IP address and enable syslog logging. Optionally, you may also specify the destination subsystem to be used on the syslog server by entering the `logging facility` command. If no other syslog server IP addresses are configured, entering the `logging` command enables both debug messaging to a syslog server and the event debug message type. As a result, the switch automatically sends Event Log messages to the syslog server, regardless of other debug types that may be configured.

b. Re-enter the `logging` command in Step 1a to configure additional syslog servers. You can configure up to a total of six servers. (When multiple server IP addresses are configured, the switch sends the debug message types that you configure in Step 3 to all IP addresses.)

2. To use a CLI session on a destination device for debug messaging:
   a. Set up a serial, Telnet, or SSH connection to access the switch's CLI.
   b. Enter the `debug destination session` command at the manager level.

3. Enable the types of debug messages to be sent to configured syslog servers, the current session device, or both by entering the `debug <debug-type>` command and selecting the desired options. Repeat this step if necessary to enable multiple debug message types.

   By default, Event Log messages are sent to configured debug destination devices. To block Event Log messages from being sent, enter the `no debug event` command.

4. If necessary, enable a subset of Event Log messages to be sent to configured syslog servers by specifying a severity level, a system module, or both using the following commands:

   ```
   switch(config)# logging severity <debug | major | error | warning | info>
   switch(config)# logging system-module <system-module>
   ```

   To display a list of valid values for each command, enter `logging severity` or `logging system-module` followed by `?` or pressing the Tab key.

   The severity levels in order from the highest to lowest severity are major, error, warning, info, and debug. For a list of valid values for the `logging system-module <system-module>` command, see Event Log system modules.

5. If you configure system-module, severity-level values, or both to filter Event Log messages, when you finish troubleshooting, you may want to reset these values to their default settings so that the switch sends all Event Log messages to configured debug destinations (syslog servers, CLI session, or both).

   To remove a configured setting and restore the default values that send all Event Log messages, enter one or both of the following commands:

   ```
   switch(config)# no logging severity <debug | major | error | warning | info>
   switch(config)# no logging system-module <system-module>
   ```

   **CAUTION:** If you configure a severity-level, system-module, logging destination, or logging facility value and save the settings to the startup configuration (For example, by entering the `write memory` command), the debug settings are saved after a system reboot (power cycle or reboot) and re-activated on the switch. As a result, after switch startup, one of the following situations may occur:

   - Only a partial set of Event Log messages may be sent to configured debug destinations.
   - Messages may be sent to a previously configured syslog server used in an earlier debugging session.
Viewing a debug/syslog configuration

Use the `show debug` command to display the currently configured settings for:

- Debug message types and Event Log message filters (severity level and system module) sent to debug destinations
- Debug destinations (syslog servers or CLI session) and syslog server facility to be used

**Syntax:**

`show debug`

Displays the currently configured debug logging destinations and message types selected for debugging purposes. (If no syslog server address is configured with the `logging <syslog-ip-addr>` command, no `show debug` command output is displayed.)

### Output of the show debug command

```
switch(config)# show debug

Debug Logging
Destination:
  Logging --
  10.28.38.164
  Facility=kern
  Severity=warning
  System module=all-pass
Enabled debug types:
  event
```

**Example:**

In the following Example:, no syslog servers are configured on the switch (default setting). When you configure a syslog server, debug logging is enabled to send Event Log messages to the server. To limit the Event Log
messages sent to the syslog server, specify a set of messages by entering the `logging severity` and `logging system-module` commands.

**Figure 87:** Syslog configuration to receive event log messages from specified system module and severity levels

As shown at the top of **Figure 87:** Syslog configuration to receive event log messages from specified system module and severity levels on page 502, if you enter the `show debug` command when no syslog server IP address is configured, the configuration settings for syslog server facility, Event Log severity level, and system module are not displayed. However, after you configure a syslog server address and enable syslog logging, all debug and logging settings are displayed with the `show debug` command.

If you do not want Event Log messages sent to syslog servers, you can block the messages from being sent by entering the `no debug event` command. (There is no effect on the normal logging of messages in the switch’s Event Log.)

**Example:**

The next Example: shows how to configure:

- Debug logging of ACL and IP-OSPF packet messages on a syslog server at 18.38.64.164 (with user as the default logging facility).
- Display of these messages in the CLI session of your terminal device’s management access to the switch.
- Blocking Event Log messages from being sent from the switch to the syslog server and a CLI session.
To configure syslog operation in these ways with the debug/syslog feature disabled on the switch, enter the commands shown in Figure 88: Debug/syslog configuration for multiple debug types and multiple destinations on page 503.

Figure 88: Debug/syslog configuration for multiple debug types and multiple destinations

```plaintext
Switch# config
Switch(config)# logging 10.38.64.164
Switch(config)# show debug

Debug Logging
Destination:
    Logging --
    10.38.64.164
    Facility-user
    Severity-debug
    System module=all-pass
Enabled debug types:
    event

Switch(config)# no debug event
Switch(config)# debug acl
Switch(config)# debug ip ospf packet
Switch(config)# debug destination session
Switch(config)# show debug

Debug Logging
Destination:
    Logging --
    10.38.64.164
    Facility-user
    Severity-debug
    System module=all-pass
Session
Enabled debug types:
    acl log
    ip ospf packet
```

### Debug command

At the manager level, use the `debug` command to perform two main functions:

- Specify the types of event messages to be sent to an external destination.
- Specify the destinations to which selected message types are sent.

By default, no debug destination is enabled and only Event Log messages are enabled to be sent.

**NOTE:**

To configure a syslog server, use the `logging <syslog-ip-addr>` command. For more information, see Configuring a syslog server on page 507.

### Debug messages

**Syntax:**

`[no] debug <debug-type>`
| acl | When a match occurs on an ACL "deny" ACE (with log configured), the switch sends an ACL message to configured debug destinations. For information on ACLs, see the "Access Control Lists (ACLs)" in the latest version of the following guides:

- IPv4 ACLs: access security guide
- IPv6 ACLs: IPv6 configuration guide

**NOTE**: ACE matches (hits) for permit and deny entries can be tracked using the show statistics aclv4 aclv6 command.

(Default: Disabled—ACL messages for traffic that matches "deny" entries are not sent.) |
| all | Configures the switch to send all debug message types to configured debug destinations. (Default: Disabled—No debug messages are sent.) |
| cdp | Sends CDP information to configured debug destinations. |
| destination | logging—Disables or re-enables syslog logging on one or more syslog servers configured with the logging syslog-ip-addr command. session—Assigns or re-assigns destination status to the terminal device that was most recently used to request debug output. buffer—Enables syslog logging to send the debug message types specified by the debug debug-type command to a buffer in switch memory. For more information on these options, see Debug destinations on page 505. |
| event | Configures the switch to send Event Log messages to configured debug destinations. **NOTE**: This value does not affect the reception of event notification messages in the Event Log on the switch. Event Log messages are automatically enabled to be sent to debug destinations in these conditions:

- If no syslog server address is configured and you enter the logging syslog-ip-addr command to configure a destination address.
- If at least one syslog server address is configured in the startup configuration, and the switch is rebooted or reset.

Event log messages are the default type of debug message sent to configured debug destinations. |
| ip [fib | forwarding | packet | rip] | Sends IP messages to configured destinations. |
| ip [fib [events]] | For the configured debug destinations:events—Sends IP forwarding information base events. |
| ip [packet] | Enables the specified PIM message type. |

*Table Continued*
### Debug Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip [rip [database</td>
<td>event</td>
</tr>
<tr>
<td>ipv6 [dhcpv6-client</td>
<td>nd</td>
</tr>
<tr>
<td>lldp</td>
<td>Enables all LLDP message types for the configured destinations.</td>
</tr>
<tr>
<td>security [arp-protect</td>
<td>dhcp-snooping</td>
</tr>
<tr>
<td>services &lt;slot-id-range&gt;</td>
<td>Displays debug messages on the services module. Enter an alphabetic module ID or range of module IDs for the &lt;slot-id-range&gt; parameter.</td>
</tr>
<tr>
<td>snmp &lt;pdu&gt;</td>
<td>Displays the SNMP debug messages. pdu—Displays SNMP pdu debug messages.</td>
</tr>
</tbody>
</table>

### Debug destinations

Use the `debug destination` command to enable (and disable) syslog messaging on a syslog server or to a CLI session for specified types of debug and Event Log messages.

**Syntax:**

```
[no] debug destination {<logging | session | buffer>}
```
**logging**

Enables syslog logging to configured syslog servers so that the debug message types specified by the `debug <debug-type>` command (see **Debug messages** on page 503) are sent. (Default: Logging disabled) To configure a syslog server IP address, see **Configuring a syslog server** on page 507.

**NOTE:** Debug messages from the switches covered in this guide have a debug severity level. Because the default configuration of some syslog servers ignores syslog messages with the debug severity level, ensure that the syslog servers you want to use to receive debug messages are configured to accept the debug level. For more information, see **Operating notes for debug and Syslog** on page 512.

**session**

Enables transmission of event notification messages to the CLI session that most recently executed this command. The session can be on any one terminal emulation device with serial, Telnet, or SSH access to the CLI at the Manager level prompt (`switch#`). If more than one terminal device has a console session with the CLI, you can redirect the destination from the current device to another device. Do so by executing `debug destination session` in the CLI on the terminal device on which you now want to display event messages. Event message types received on the selected CLI session are configured with the `debug <debug-type>` command.

**buffer**

Enables syslog logging to send the debug message types specified by the `debug <debug-type>` command to a buffer in switch memory. To view the debug messages stored in the switch buffer, enter the `show debug buffer` command.

---

**Logging command**

At the global configuration level, the `logging` command allows you to enable debug logging on specified syslog servers and select a subset of Event Log messages to send for debugging purposes according to:

- Severity level
- System module

By specifying both a severity level and system module, you can use both configured settings to filter the Event Log messages you want to use to troubleshoot switch or network error conditions.

**CAUTION:**

After you configure a syslog server and a severity level and/or system module to filter the Event Log messages that are sent, if you save these settings to the startup configuration file by entering the `write memory` command, these debug and logging settings are automatically re-activated after a switch reboot or power recycle. The debug settings and destinations configured in your previous troubleshooting session will then be applied to the current session, which may not be desirable.

After a reboot, messages remain in the Event Log and are not deleted. However, after a power recycle, all Event Log messages are deleted.

If you configure a severity level, system module, or both to temporarily filter Event Log messages, be sure to reset the values to their default settings by entering the `no` form of the following commands to ensure that Event Log messages of all severity levels and from all system modules are sent to configured syslog servers:

```bash
switch(config)# no logging severity <debug | major | error | warning | info>
switch(config)# no logging system-module <system-module>
```
Configuring a syslog server

Syslog is a client-server logging tool that allows a client switch to send event notification messages to a networked device operating with syslog server software. Messages sent to a syslog server can be stored to a file for later debugging analysis.

To use the syslog feature, you must install and configure a syslog server application on a networked host accessible to the switch. For instructions, see the documentation for the syslog server application.

To configure a syslog service, use the `logging <syslog-ip-addr>` command as shown below.

When you configure a syslog server, Event Log messages are automatically enabled to be sent to the server. To reconfigure this setting, use the following commands:

- `debug`
  Specifies additional debug message types (see [Debug messages](#) on page 503).

- `logging`
  Configures the system module or severity level used to filter the Event Log messages sent to configured syslog servers. (See [Configuring the severity level for Event Log messages sent to a syslog server](#) on page 510 and [Configuring the system module used to select the Event Log messages sent to a syslog server](#) on page 511.)

To display the currently configured syslog servers as well as the types of debug messages and the severity-level and system-module filters used to specify the Event Log messages that are sent, enter the `show debug` command (See [Debug/syslog configuration commands](#) on page 496).

Syntax:

```
[no] logging <syslog-ip-addr>
```

Enables or disables syslog messaging to the specified IP address. You can configure up to six addresses. If you configure an address when none are already configured, this command enables destination logging (syslog) and the Event debug type. Therefore, at a minimum, the switch begins sending Event Log messages to configured syslog servers. The ACL, IP-OSPF, and/or IP-RIP message types are also sent to the syslog servers if they are currently enabled as debug types. (See [Debug messages](#) on page 503.)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no logging</code></td>
<td>Removes all currently configured syslog logging destinations from the running configuration. Using this form of the command to delete the only remaining syslog server address disables debug destination logging on the switch, but the default Event debug type does not change.</td>
</tr>
<tr>
<td><code>no logging &lt;syslog-ip-address&gt;</code></td>
<td>Removes only the specified syslog logging destination from the running configuration. Removing all configured syslog destinations with the <code>no logging</code> command (or a specified syslog server destination with the <code>no logging &lt;syslog-ip-address&gt;</code> command) does not delete the syslog server IP addresses stored in the startup configuration.</td>
</tr>
</tbody>
</table>

Deleting syslog addresses in the startup configuration

Enter a `no logging` command followed by the `write memory` command.

Verifying the deletion of a syslog server address

Display the startup configuration by entering the `show config` command.
Blocking the messages sent to configured syslog servers from the currently configured debug message type

Enter the `no debug <debug-type>` command. (See Debug messages on page 503.)

Disabling syslog logging on the switch without deleting configured server addresses

Enter the `no debug destination logging` command. Note that, unlike the case in which no syslog servers are configured, if one or more syslog servers are already configured and syslog messaging is disabled, configuring a new server address does not re-enable syslog messaging. To re-enable syslog messaging, you must enter the `debug destination logging` command.

Sending logging messages using TCP

Syntax:

```
[no] logging <ip-addr> [udp 1024-49151 | tcp 1024-49151]
```

Allows the configuration of the UDP or TCP transport protocol for the transmission of logging messages to a syslog server.

Specifying a destination port with UDP or TCP is optional.

Default ports: UDP port is 514
TCP port is 1470

Default Transport Protocol: UDP

Because TCP is a connection-oriented protocol, a connection must be present before the logging information is sent. This helps ensure that the logging message will reach the syslog server. Each configured syslog server needs its own connection. You can configure the destination port that is used for the transmission of the logging messages.

<table>
<thead>
<tr>
<th>Configuring TCP for logging message transmission using the default port</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)# logging 192.123.4.5 tcp</td>
</tr>
<tr>
<td>(Default TCP port 1470 is used.)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Configuring TCP for logging message transmission using a specified port</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)# logging 192.123.4.5 9514</td>
</tr>
<tr>
<td>(TCP port 9514 is used.)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Configuring UDP for logging message transmission using the default port</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)# logging 192.123.4.5 udp</td>
</tr>
<tr>
<td>(Default UDP port 514 is used.)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Configuring UDP for logging message transmission using a specified port</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)# logging 192.123.4.5 9512</td>
</tr>
</tbody>
</table>
UDP port 9512 is used.

Syntax:

```
[no] logging facility <facility-name>
```

The logging facility specifies the destination subsystem used in a configured syslog server. (All configured syslog servers must use the same subsystem.) Hewlett Packard Enterprise recommends the default (user) subsystem unless your application specifically requires another subsystem. Options include:

<table>
<thead>
<tr>
<th>Facility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>(default) Random user-level messages</td>
</tr>
<tr>
<td>kern</td>
<td>Kernel messages</td>
</tr>
<tr>
<td>mail</td>
<td>Mail system</td>
</tr>
<tr>
<td>daemon</td>
<td>System daemons</td>
</tr>
<tr>
<td>auth</td>
<td>Security/authorization messages</td>
</tr>
<tr>
<td>syslog</td>
<td>Messages generated internally by syslog</td>
</tr>
<tr>
<td>lpr</td>
<td>Line-printer subsystem</td>
</tr>
<tr>
<td>news</td>
<td>Netnews subsystem</td>
</tr>
<tr>
<td>uucp</td>
<td>uucp subsystem</td>
</tr>
<tr>
<td>cron</td>
<td>cron/at subsystem</td>
</tr>
<tr>
<td>sys9</td>
<td>cron/at subsystem</td>
</tr>
<tr>
<td>sys10 - sys14</td>
<td>Reserved for system use</td>
</tr>
<tr>
<td>local10 - local17</td>
<td>Reserved for system use</td>
</tr>
</tbody>
</table>

Use the `no` form of the command to remove the configured facility and reconfigure the default (user) value.

### Adding a description for a Syslog server

You can associate a user-friendly description with each of the IP addresses (IPv4 only) configured for syslog using the CLI or SNMP.

**NOTE:**

The Hewlett Packard Enterprise MIB `hpicfSyslog.mib` allows the configuration and monitoring of syslog for SNMP (RFC 3164 supported).

**CAUTION:**

Entering the `no logging` command removes ALL the syslog server addresses without a verification prompt.

The CLI command is:
Syntax:

logging <ip-addr> [control-descr ZZZTRISHZZZZ <text_string>]
no logging <ip-addr> [control-descr]

An optional user-friendly description that can be associated with a server IP address. If no description is entered, this is blank. If <text_string> contains white space, use quotes around the string. IPv4 addresses only.

Use the no form of the command to remove the description. Limit: 255 characters

NOTE:
To remove the description using SNMP, set the description to an empty string.

The logging command with a control description

switch(config)# logging 10.10.10.2 control-descr syslog_one

Adding a priority description

This description can be added with the CLI or SNMP. The CLI command is:

Syntax:

logging priority-descr <text_string>
no logging priority-descr

Provides a user-friendly description for the combined filter values of severity and system module. If no description is entered, this is blank.

If text_string contains white space, use quotes around the string.

Use the no form of the command to remove the description.

Limit: 255 characters

The logging command with a priority description

switch(config)# logging priority-descr severe-pri

NOTE:
A notification is sent to the SNMP agent if there are any changes to the syslog parameters, either through the CLI or with SNMP.

Configuring the severity level for Event Log messages sent to a syslog server

Event Log messages are entered with one of the following severity levels (from highest to lowest):

<table>
<thead>
<tr>
<th>Severity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major</td>
<td>A fatal error condition has occurred on the switch.</td>
</tr>
<tr>
<td>Error</td>
<td>An error condition has occurred on the switch.</td>
</tr>
<tr>
<td>Warning</td>
<td>A switch service has behaved unexpectedly.</td>
</tr>
</tbody>
</table>

Table Continued
Information | Information on a normal switch event.
---|---
Debug | Reserved for switch internal diagnostic information.

Using the `logging severity` command, you can select a set of Event Log messages according to their severity level and send them to a syslog server. Messages of the selected and higher severity will be sent. To configure a syslog server, see [Configuring a syslog server](#) on page 507.

**Syntax:**

```
[no] logging severity {< major | error | warning | info | debug >}
```

Configures the switch to send all Event Log messages with a severity level equal to or higher than the specified value to all configured Syslog servers.

Default: `debug` *(Reports messages of all severity levels.)*

Use the `no` form of the command to remove the configured severity level and reconfigure the default value, which sends Event Log messages of all severity levels to syslog servers.

---

**NOTE:** The severity setting does not affect event notification messages that the switch normally sends to the Event Log. All messages remain recorded in the Event Log.

---

### Configuring the system module used to select the Event Log messages sent to a syslog server

Event Log messages contain the name of the system module that reported the event. Using the `logging system-module` command, you can select a set of Event Log messages according to the originating system module and send them to a syslog server.

**Syntax:**

```
[no] logging system-module <system-module>
```

Configures the switch to send all Event Log messages being logged from the specified system module to configured syslog servers. *(To configure a syslog server, see [Configuring a syslog server](#).)*

See [Event Log system modules](#) for the correct value to enter for each system module.

Default: `all-pass` *(Reports all Event Log messages.)*

Use the `no` form of the command to remove the configured system module value and reconfigure the default value, which sends Event Log messages from all system modules to syslog servers.

You can select messages from only one system module to be sent to a syslog server; you cannot configure messages from multiple system modules to be sent. If you re-enter the command with a different system module name, the currently configured value is replaced with the new one.

---

**NOTE:** This setting has no effect on event notification messages that the switch normally sends to the Event Log.

### Enabling local command logging

Use this command to enable local command logging. This satisfies the NDcPP certification requirement that:

- All administrative actions (commands) are logged locally.
- Local command log storage can be enabled and disabled.
• The identity of the user causing an event is logged.
• When the command log is exhausted by 80% and wraparound occurs, the event is logged and a trap is generated.
• Log messages have a maximum of 240 characters (the RMON event maximum string length) and are stored in the command log buffer.
• Log messages greater than the maximum length are truncated and are not stored in the command log buffer.

Syntax:

[no] logging command

Operating notes for debug and Syslog

• Rebooting the switch or pressing the Reset button resets the debug configuration.

<table>
<thead>
<tr>
<th>Debug option</th>
<th>Effect of a reboot or reset</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging (debug destination)</td>
<td>If syslog server IP addresses are stored in the startup-config file, they are saved across a reboot and the logging destination option remains enabled. Otherwise, the logging destination is disabled.</td>
</tr>
<tr>
<td>session (debug destination)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>ACL (debug type)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>All (debug type)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>event (debug type)</td>
<td>If a syslog server IP address is configured in the startup-config file, the sending of Event Log messages is reset to enabled, regardless of the last active setting. If no syslog server is configured, the sending of Event Log messages is disabled.</td>
</tr>
<tr>
<td>IP (debug type)</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

• Debug commands do not affect normal message output to the Event Log.

Using the debug event command, you can specify that Event Log messages are sent to the debug destinations you configure (CLI session, syslog servers, or both) in addition to the Event Log.

• Ensure that your syslog servers accept debug messages.

All syslog messages resulting from a debug operation have a "debug" severity level. If you configure the switch to send debug messages to a syslog server, ensure that the server’s syslog application is configured to accept the "debug" severity level. (The default configuration for some syslog applications ignores the "debug" severity level.)

• Duplicate IP addresses are not stored in the list of syslog servers.
• If the default severity value is in effect, all messages that have severities greater than the default value are passed to syslog. For example, if the default severity is "debug," all messages that have severities greater than debug are passed to syslog.

• There is a limit of six syslog servers. All syslog servers are sent the same messages using the same filter parameters. An error is generated for an attempt to add more than six syslog servers.

### Diagnostic tools

#### Port auto-negotiation

When a link LED does not light (indicating loss of link between two devices), the most common reason is a failure of port auto-negotiation between the connecting ports. If a link LED fails to light when you connect the switch to a port on another device, do the following:

**Procedure**

1. Ensure that the switch port and the port on the attached end-node are both set to Auto mode.
2. If the attached end-node does not have an Auto mode setting, you must manually configure the switch port to the same setting as the end-node port.

#### Ping and link tests

The ping test and the link test are point-to-point tests between your switch and another IEEE 802.3-compliant device on your network. These tests can tell you whether the switch is communicating properly with another device.

![NOTE:]

To respond to a ping test or a link test, the device you are trying to reach must be IEEE 802.3-compliant.

**Ping test**

A test of the path between the switch and another device on the same or another IP network that can respond to IP packets (ICMP Echo Requests). To use the ping (or traceroute) command with host names or fully qualified domain names, see [DNS resolver](#) on page 530.

**Link test**

A test of the connection between the switch and a designated network device on the same LAN (or VLAN, if configured). During the link test, IEEE 802.2 test packets are sent to the designated network device in the same VLAN or broadcast domain. The remote device must be able to respond with an 802.2 Test Response Packet.

#### Executing ping or link tests (WebAgent)

To start a ping or link test in the WebAgent:

1. In the navigation pane, click **Troubleshooting**.
2. Click **Ping/Link Test**.
3. Click **Start**.
4. To halt a link or ping test before it concludes, click **Stop**.
For an Example: of the text screens, see Figure 89: Ping test and link test screen on the WebAgent on page 514.

**Figure 89: Ping test and link test screen on the WebAgent**

![Ping test and link test screen on the WebAgent](image)

**Destination IP Address** is the network address of the target, or destination, device to which you want to test a connection with the switch. An IP address is in the X.X.X.X format where X is a decimal number between 0 and 255.

**Number of Packets to Send** is the number of times you want the switch to attempt to test a connection.

**Timeout in Seconds** is the number of seconds to allow per attempt to test a connection before determining that the current attempt has failed.

**Testing the path between the switch and another device on an IP network**

The ping test uses ICMP echo requests and ICMP echo replies to determine if another device is alive. It also measures the amount of time it takes to receive a reply from the specified destination. The `ping` command has several extended commands that allow advanced checking of destination availability.

**Syntax:**

```
ping \{<ip-address | hostname>\} [repetitions <1-10000>] [timeout <1-60>] [source <\{ip-address | <vlan-id> | loopback <0-7>\}>] [data-size <0-65471>] [data-fill <0-1024>] [ip-option \{<record-route | loose-source-route | strict-source-route | include-timestamp | include-timestamp-and-address | include timestamp-from\}>] [tos <0-255>]
```

```
ping6 \{<ipv6-address | hostname>\} [repetitions <1-10000>] [timeout <1-60>] [source <\{ip-address | vlan-id | loopback <0-7>\}>] [data-size <0-65471>] [data-fill <0-1024>]
```

Sends ICMP echo requests to determine if another device is alive.

| `< ip-address | hostname >` | Target IP address or hostname of the destination node being pinged |
|-------------------------|---------------------------------------------------------------|
| repetitions `<1-10000>` | Number of ping packets sent to the destination address.        |
|                         | Default: 1                                                   |

*Table Continued*
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout &lt;1-60&gt;</td>
<td>Timeout interval in seconds; the ECHO REPLY must be received before this time interval expires for the ping to be successful. Default: 5</td>
</tr>
<tr>
<td>source {&lt; ip-addr</td>
<td>vid</td>
</tr>
<tr>
<td>data-size &lt;0-65471&gt;</td>
<td>Size of packet sent. Default: 0 (zero)</td>
</tr>
<tr>
<td>data-fill &lt;0-1024&gt;</td>
<td>The data pattern in the packet. Default: Zero length string</td>
</tr>
<tr>
<td>ip-option</td>
<td>Specify an IP option, such as loose or strict source routing, or an include-timestamp option: include-timestamp: Adds the timestamp option to the IP header. The timestamp displays the amount of travel time to and from a host. Default: 9 include-timestamp-and-address: Records the intermediate router's timestamp and IP address. Default: 4 include-timestamp-from: Records the timestamp of the specified router addresses. loose-source-route &lt;IP-addr&gt;: The loose-source-route option prompts for the IP address of each source IP on the path. It allows you to specify the IP addresses that you want the ping packet to go through; the packet may go through other IP addresses as well. record-route &lt;1-9&gt;: Displays the IP addresses of the interfaces that the ping packet goes through on its way to the destination and on the way back. When specified without loose or strict recording, the source route is not recorded. The source route is automatically recorded when loose or strict source routing is enabled. Default: 9 strict-source-route &lt;IP-addr&gt;: Restricts the ping packet to only those IP addresses that have been specified and no other addresses.</td>
</tr>
<tr>
<td>tos &lt;0-255&gt;</td>
<td>Specifies the type of service to be entered in the header packet. Default: 0 (zero)</td>
</tr>
</tbody>
</table>

**Ping tests**

```plaintext
switch# ping 10.10.10.10
10.10.10.10 is alive, time = 15 ms

switch# ping 10.10.10.10 repetitions 3
10.10.10.10 is alive, iteration 1, time = 15 ms
10.10.10.10 is alive, iteration 1, time = 15 ms
10.10.10.10 is alive, iteration 1, time = 15 ms

switch# ping 10.10.10.10 timeout 2
10.10.10.10 is alive, time = 10 ms
```

Chapter 13 Troubleshooting 515
switch# ping 10.11.12.13
The destination address is unreachable.

### Halting a ping test

To halt a ping test before it concludes, press [Ctrl] [C].

---

**NOTE:**

To use the `ping` (or `traceroute`) command with host names or fully qualified domain names, see **DNS resolver** on page 530.

---

### Issuing single or multiple link tests

Single or multiple link tests can have varying repetitions and timeout periods. The defaults are:

- Repetitions: 1 (1 to 999)
- Timeout: 5 seconds (1 to 256 seconds)

**Syntax:**

```
link <mac-address> [repetitions <1-999>] [timeout <1-256>] [vlan <vlan-id>]
```

**Example:**

**Figure 90: Link tests**

| Basic Link Test | Switch# link 0030c1-7fcc40
link-test passed. |
|-----------------|--------------------------|
| Link Test with Repetitions | Switch# link 0030c1-7fcc40 repetitions 3
802.2 TEST packets sent: 3, responses received: 3 |
| Link Test with Repetitions and Timeout | Switch# link 0030c1-7fcc40 repetitions 3 timeout 1
802.2 TEST packets sent: 3, responses received: 3 |
| Link Test Over a Specific VLAN | Switch# link 0030c1-7fcc40 repetitions 3 timeout 1 vlan 1
802.2 TEST packets sent: 3, responses received: 3 |
| Link Test Over a Specific VLAN: Test Fail | Switch# link 0030c1-7fcc40 repetitions 3 timeout 1 vlan 222
802.2 TEST packets sent: 3, responses received: 0 |

### Tracing the route from the switch to a host address

The `traceroute` command enables you to trace the route from the switch to a host address.

This command outputs information for each (router) hop between the switch and the destination address. Note that every time you execute `traceroute`, it uses the same default settings unless you specify otherwise for that instance of the command.

**Syntax:**

```
traceroute {< ip-address | hostname >} [maxttl <1-255>] [minttl <1-255>] [probes
```
### traceroute Command Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`&lt;ip-address</td>
<td>hostname &gt;`</td>
</tr>
<tr>
<td><code>[minttl &lt; 1-255 &gt;]</code></td>
<td>For the current instance of <code>traceroute</code>, changes the minimum number of hops allowed for each probe packet sent along the route.</td>
</tr>
<tr>
<td></td>
<td>• If <code>minttl</code> is greater than the actual number of hops, the output includes only the hops at and above the <code>minttl</code> threshold. (The hops below the threshold are not listed.)</td>
</tr>
<tr>
<td></td>
<td>• If <code>minttl</code> matches the actual number of hops, only that hop is shown in the output.</td>
</tr>
<tr>
<td></td>
<td>• If <code>minttl</code> is less than the actual number of hops, all hops are listed.</td>
</tr>
<tr>
<td><code>[maxttl &lt; 1-255 &gt;]</code></td>
<td>For the current instance of <code>traceroute</code>, changes the maximum number of hops allowed for each probe packet sent along the route. If the destination address is further from the switch than <code>maxttl</code> allows, <code>traceroute</code> lists the IP addresses for all hops it detects up to the <code>maxttl</code> limit. For any instance of <code>traceroute</code>, if you want a <code>maxttl</code> value other than the default, you must specify that value. (Default: 30)</td>
</tr>
<tr>
<td><code>[probes &lt; 1-5 &gt;]</code></td>
<td>For the current instance of <code>traceroute</code>, changes the number of queries the switch sends for each hop in the route. For any instance of <code>traceroute</code>, if you want a <code>probes</code> value other than the default, you must specify that value. (Default: 3)</td>
</tr>
<tr>
<td>`[source {&lt;ip-address</td>
<td>source-vlan &lt;vid&gt;</td>
</tr>
<tr>
<td><code>[dstport &lt; 1-34000 &gt;]</code></td>
<td>Destination port.</td>
</tr>
</tbody>
</table>

*Table Continued*
Specify an IP option, such as loose or strict source routing, or an include-timestamp option:
- **[include-timestamp]**: Adds the timestamp option to the IP header. The timestamp displays the amount of travel time to and from a host. Default: 9
- **[include-timestamp-and-address]**: Records the intermediate router's timestamp and IP address. Default: 4
- **[loose-source-route <IP-addr>]**: Prompts for the IP address of each source IP on the path. It allows you to specify the IP addresses that you want the ping packet to go through; the packet may go through other IP addresses as well.
- **[record-route <1-9>]**: Displays the IP addresses of the interfaces that the ping packet goes through on its way to the destination and on the way back. When specified without loose or strict recording, the source route is not recorded. The source route is automatically recorded when loose or strict source routing is enabled. Default: 9
- **[strict-source-route <IP-addr>]**: Restricts the ping packet to only those IP addresses that have been specified and no other addresses.
- **[timeout <1-120>]**: For the current instance of traceroute, changes the timeout period the switch waits for each probe of a hop in the route. For any instance of traceroute, if you want a timeout value other than the default, you must specify that value. (Default: 5 seconds)

**NOTE:** For information about traceroute6, see the IPv6 configuration guide for your switch.

### Halting an ongoing traceroute search

Press the **[Ctrl] [C]** keys.

### A low maxttl causes traceroute to halt before reaching the destination address

Executing `traceroute` with its default values for a destination IP address that is four hops away produces a result similar to this:

**Figure 91: A completed traceroute enquiry**

```
Switch# traceroute 125.252.4.35
trace to 125.252.4.35,
  1  10.255.120.2  10 ms  0 ms  0 ms
  2  10.71.217.2  7 ms   3 ms  0 ms
  3  10.243.170.1  0 ms   1 ms  0 ms
  4 125.252.4.35   3 ms   3 ms  0 ms
```

**Intermediate router hops**

With the time taken for the switch to receive acknowledgement of each probe reaching each router.
Continuing from the previous Example: (Figure 91: A completed traceroute enquiry on page 518), executing `traceroute` with an insufficient `maxttl` for the actual hop count produces an output similar to this:

**Figure 92: Incomplete traceroute because of low maxttl setting**

```
Switch# traceroute 125.25.24.35 maxttl 3
traceroute to 125.25.24.35,
  1 hop min, 30 hops max, 5 sec. timeout, 3 probes
1 10.255.120.2 0 ms 0 ms 0 ms
2 10.71.217.2 0 ms 0 ms 0 ms
3 10.243.170.1 0 ms * 0 ms
```

The asterisk indicates there was a timeout on the second probe to the third hop.

If a network condition prevents traceroute from reaching the destination

Common reasons for `traceroute` failing to reach a destination include:

- Timeouts (indicated by one asterisk per probe, per hop)
- Unreachable hosts
- Unreachable networks
- Interference from firewalls
- Hosts configured to avoid responding

Executing `traceroute` where the route becomes blocked or otherwise fails results in an output marked by timeouts for all probes beyond the last detected hop. For example, with a maximum hop count of 7 (`maxttl = 7`), where the route becomes blocked or otherwise fails, the output appears similar to this:

**Figure 93: Traceroute failing to reach the destination address**

```
At hop 3, the first and third probes timed out but the second probe reached the router.
All further probes within the maxttl timed-out without finding a router or the destination IP address.
```

```
Switch# traceroute 125.25.24.35 maxttl 7
traceroute to 107.64.197.100,
  1 hop min, 7 hops max, 5 sec. timeout, 3 probes
1 10.255.120.2 0 ms 0 ms 0 ms
2 10.71.217.2 0 ms 0 ms 0 ms
3 *10.243.170.1* * * * * 0 ms *
4 * * * * * * * * *
5 * * * * * * * * *
6 * * * * * * * * *
7 * * * * * * * *
```

An asterisk indicates a timeout without finding the next hop.

Viewing switch configuration and operation

In some troubleshooting scenarios, you may need to view the switch configuration to diagnose a problem. The complete switch configuration is contained in a file that you can browse from the CLI using the commands described in this section.

**Viewing the startup or running configuration file**

**Syntax:**

```
write terminal
```

Displays the running configuration.
**show config**
Displays the startup configuration.

**show running-config**
Displays the running-config file.

For more information and examples of how to use these commands, see “Switch Memory and Configuration” in the basic operation guide.

**Viewing the configuration file (WebAgent)**
To display the running configuration using the WebAgent:

1. In the navigation pane, click **Troubleshooting**.
2. Click **Configuration Report**.
3. Use the right-side scroll bar to scroll through the configuration listing.

**Viewing a summary of switch operational data**
**Syntax:**

```
show tech
```

By default, the `show tech` command displays a single output of switch operating and running-configuration data from several internal switch sources, including:

- Image stamp (software version data)
- Running configuration
- Event Log listing
- Boot history
- Port settings
- Status and counters — port status
- IP routes
- Status and counters — VLAN information
- GVRP support
- Load balancing (trunk and LACP)

**The show tech command** on page 520 shows sample output from the `show tech` command.

**The show tech command**

```
switch# show tech

show system

Status and Counters - General System Information

  System Name       : Switch
  System Contact    :
  System Location   :

Aruba 2930F / 2930M Management and Configuration Guide
for ArubaOS-Switch 16.07
520
To specify the data displayed by the `show tech` command, use the `copy show tech` command.

**Saving show tech command output to a text file**

When you enter the `show tech` command, a summary of switch operational data is sent to your terminal emulator. You can use your terminal emulator's text capture features to save the `show tech` data to a text file for viewing, printing, or sending to an associate to diagnose a problem.

For example, if your terminal emulator is the Hyperterminal application available with Microsoft® Windows® software, you can copy the `show tech` output to a file and then use either Microsoft Word or Notepad to display the data. (In this case, Microsoft Word provides the data in an easier-to-read format.)

The following example uses the Microsoft Windows terminal emulator. If you are using a different terminal emulator application, see the documentation provided with the application.
Procedure

1. In Hyperterminal, click on Transfer|Capture Text….

   Figure 94: Capture text window of the Hyperterminal application

2. In the File field, enter the path and file name in which you want to store the show tech output.

   Figure 95: Entering a path and filename for saving show tech output

3. Click [Start] to create and open the text file.

4. From the global configuration context, enter the show tech command:

   switch# show tech

   The show tech command output is copied into the text file and displayed on the terminal emulator screen. When the command output stops and displays -- MORE --, press the Space bar to display and copy more information. The CLI prompt appears when the command output finishes.

5. Click on Transfer|Capture Text|Stop in HyperTerminal to stop copying data and save the text file.

   If you do not stop HyperTerminal from copying command output into the text file, additional unwanted data can be copied from the HyperTerminal screen.

6. To access the file, open it in Microsoft Word, Notepad, or a similar text editor.

Customizing show tech command output

Use the copy show tech command to customize the detailed switch information displayed with the show tech command to suit your troubleshooting needs.

To customize the information displayed with the show tech command:

Procedure

1. Determine the information that you want to gather to troubleshoot a problem in switch operation.

2. Enter the copy show tech command to specify the data files that contain the information you want to view.
Syntax:

`copy <source> show-tech`

Specifies the operational and configuration data from one or more source files to be displayed by the `show tech` command. Enter the command once for each data file that you want to include in the display.

Default: Displays data from all source files, where `<source>` can be any one of the following values:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>command-output &quot;&lt;command&gt;&quot;</code></td>
<td>Includes the output of a specified command in <code>show-tech</code> command output.</td>
</tr>
<tr>
<td></td>
<td>Enter the command name between double-quotation marks, For example, <code>copy &quot;show system&quot; show-tech</code>.</td>
</tr>
<tr>
<td>`crash-data [slot-id</td>
<td>master]`</td>
</tr>
<tr>
<td></td>
<td>To limit the amount of crash data displayed, specify an installed module or management modules, where:</td>
</tr>
<tr>
<td></td>
<td>• <code>slot-id</code>: Includes the crash data from an installed module. Valid slot IDs are the letters <code>a</code> through <code>h</code>.</td>
</tr>
<tr>
<td></td>
<td>• <code>master</code>: Includes the crash data from both management modules.</td>
</tr>
<tr>
<td>`crash-log [slot-id</td>
<td>master]`</td>
</tr>
<tr>
<td></td>
<td>To limit the amount of crash-log data displayed, specify an installed module or management modules, where:</td>
</tr>
<tr>
<td></td>
<td>• <code>slot-id</code>: Includes the crash log from an installed module. Valid slot IDs are the letters <code>a</code> through <code>h</code>.</td>
</tr>
<tr>
<td></td>
<td>• <code>master</code>: Includes the crash log from both management modules.</td>
</tr>
<tr>
<td><code>event-log</code></td>
<td>Copies the contents of the Event Log to <code>show tech</code> command output.</td>
</tr>
<tr>
<td><code>running-config</code></td>
<td>Includes the contents of the running configuration file in <code>show tech</code> command output.</td>
</tr>
<tr>
<td><code>startup-config</code></td>
<td>Includes the contents of the startup configuration file in <code>show tech</code> command output.</td>
</tr>
</tbody>
</table>

Table Continued
**tftp config {<startup-config | running-config} <ip-addr> <remote-file>{<pc | unix>}

Downloads the contents of a configuration file from a remote host to show tech command output, where:

*<ip-addr>*: Specifies the IP address of the remote host device.

*<remote-file>*: Specifies the pathname on the remote host for the configuration file whose contents you want to include in the command output.

*pc|unix*: Specifies whether the remote host is a DOS-based PC or UNIX workstation.

For more information on using `copy tftp` commands, see [File Transfers](#) on page 330.

**xmodem config {<startup-config | config < filename > | command-file < acl-filename.txt >} {<pc | unix>}

Copies the contents of a configuration file or ACL command file from a serially connected PC or UNIX workstation to show tech command output, where:

*startup-config*: Specifies the name of the startup configuration file on the connected device.

*config <filename>*: Specifies the pathname of a configuration file on the connected device.

*command-file <acl-filename.txt>*: Specifies the pathname of an ACL command file on the connected device.

*pc|unix*: Specifies whether the connected device is a DOS-based PC or UNIX workstation.

For more information on using `copy xmodem` commands, see [File Transfers](#) on page 330.

---

### Viewing more information on switch operation

Use the following commands to display additional information on switch operation for troubleshooting purposes.

**Syntax:**

```
show boot-history
```

Displays the crash information saved for each management module on the switch.

```
show history
```

Displays the current command history. This command output is used for reference or when you want to repeat a command (See [Displaying the information you need to diagnose problems](#) on page 527).

```
show system-information
```

Displays globally configured parameters and information on switch operation.

```
show version
```

Displays the software version currently running on the switch and the flash image from which the switch booted (primary or secondary). For more information, see "Displaying Management Information" in the "Redundancy (Switch 8212zl)".

```
show interfaces
```

Displays information on the activity on all switch ports (see "Viewing Port Status and Configuring Port Parameters" in the "Port Status and Configuration").

```
show interfaces-display
```

Displays the same information as the `show interfaces` command and dynamically updates the output every three seconds. Press Ctrl + C to stop the dynamic updates of system information. Use the Arrow keys to view information that is off the screen.

**Searching for text using pattern matching with show command**

Selected portions of the output are displayed, depending on the parameters chosen.

**Syntax:**

```
show {< command option > | < include | exclude | begin >} <regular expression>
```

Uses matching pattern searches to display selected portions of the output from a `show` command. There is no limit to the number of characters that can be matched. Only regular expressions are permitted; symbols such as the asterisk cannot be substituted to perform more general matching.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>include</code></td>
<td>Only the lines that contain the matching pattern are displayed in the output.</td>
</tr>
<tr>
<td><code>exclude</code></td>
<td>Only the lines that contain the matching pattern are <strong>not</strong> displayed in the output.</td>
</tr>
<tr>
<td><code>begin</code></td>
<td>The display of the output begins with the line that contains the matching pattern.</td>
</tr>
</tbody>
</table>

**NOTE:** Pattern matching is case-sensitive.

Following are examples of what portions of the running config file display depending on the option chosen.

**Pattern matching with include option**

```
switch(config)# show run | include ipv6
ipv6 enable
ipv6 enable
ipv6 access-list "EH-01"
switch(config)#
```

1Displays only lines that contain “ipv6”.

**Pattern matching with exclude option**

```
switch(config)# show run | exclude ipv6
Running configuration:
; J9299A Configuration Editor; Created on release #WB.15.XX
```
hostname "Switch"
snmp-server community "notpublic" Unrestricted
vlan 1
  name "DEFAULT_VLAN"
  untagged A1-A24,B1-B20
  ip address dhcp-bootp
  no untagged B21-B24
  exit
vlan 20
  name "VLAN20"
  untagged B21-B24
  no ip address
  exit
policy qos "michael"
  exit
  exit
no autorun
password manager

1Displays all lines that do not contain “ipv6”.

Pattern matching with begin option

switch(config)# show run | begin ipv6 1
  ipv6 enable
  no untagged 21-24
  exit
vlan 20
  name "VLAN20"
  untagged 21-24
  ipv6 enable
  no ip address
  exit
policy qos "michael"
  exit
  ipv6 access-list "EH-01"
    exit
  no autorun
password manager

1Displays the running config beginning at the first line that contains “ipv6”.

The following is an Example: of the show arp command output, and then the output displayed when the include option has the IP address of 15.255.128.1 as the regular expression.

The show arp command and pattern matching with the include option

switch(config)# show arp
  IP ARP table
  IP Address      MAC Address    Type    Port
  --------------- --------------- ------- ----
  15.255.128.1    00000c-07ac00  dynamic B1
  15.255.131.19   00a0c9-b1503d  dynamic
  15.255.133.150  00bcd-3cbeec  dynamic B1
switch(config)# show arp | include 15.255.128.1
  15.255.128.1     00000c-07ac00  dynamic B1

Displaying the information you need to diagnose problems

Use the following commands in a troubleshooting session to more accurately display the information you need to diagnose a problem.

**Syntax:**

alias

Creates a shortcut alias name for commonly used commands and command options.

**Syntax:**

kill

Terminates a currently running, remote troubleshooting session. Use the `show ip ssh` command to list the current management sessions.

**Syntax:**

[no] page

Toggles the paging mode for `show` commands between continuous listing and per-page listing.

**Syntax:**

repeat

Repeatedly executes one or more commands so that you can see the results of multiple commands displayed over a period of time. To halt the command execution, press any key on the keyboard.

**Syntax:**

setup

Displays the Switch Setup screen from the menu interface.

**Restoring the factory-default configuration**

As part of your troubleshooting process, it may become necessary to return the switch configuration to the factory default settings. This process:

- Momentarily interrupts the switch operation
- Clears any passwords
- Clears the console Event Log
- Resets the network counters to zero
- Performs a complete self test
- Reboots the switch into its factory default configuration, including deleting an IP address

There are two methods for resetting to the factory-default configuration:
• CLI
• Clear/Reset button combination

NOTE: Hewlett Packard Enterprise recommends that you save your configuration to a TFTP server before resetting the switch to its factory-default configuration. You can also save your configuration via Xmodem to a directly connected PC.

Resetting to the factory-default configuration

Using the CLI
This command operates at any level except the Operator level.

Syntax:

erase startup-configuration

Deletes the startup-config file in flash so that the switch will reboot with its factory-default configuration.

NOTE:
The erase startup-config command does not clear passwords unless include-credentials has been set, at which time this command does erase username/password information and any other credentials stored in the config file. For more information, see the section on "Saving Security Credentials in a Config File" in the access security guide for your switch.

Using Clear/Reset

Procedure
1. Using pointed objects, simultaneously press both the Reset and Clear buttons on the front of the switch.
2. Continue to press the Clear button while releasing the Reset button.
3. When the Self Test LED begins to flash, release the Clear button.

The switch then completes its self test and begins operating with the configuration restored to the factory default settings.

Restoring a flash image

The switch can lose its operating system if either the primary or secondary flash image location is empty or contains a corrupted OS file and an operator uses the erase flash command to erase a good OS image file from the opposite flash location.

Recovering from an empty or corrupted flash state

Use the switch’s console serial port to connect to a workstation or laptop computer that has the following:

• A terminal emulator program with Xmodem capability, such as the HyperTerminal program included in Windows PC software.
• A copy of a good OS image file for the switch
NOTE: The following procedure requires the use of Xmodem and copies an OS image into primary flash only.

This procedure assumes you are using HyperTerminal as your terminal emulator. If you use a different terminal emulator, you may need to adapt this procedure to the operation of your particular emulator.

1. Start the terminal emulator program.
   Ensure that the terminal program is configured as follows:
   - Baud rate: 9600
   - No parity
   - 8 Bits
   - 1 stop bit
   - No flow control

2. Use the Reset button to reset the switch.
   The following prompt should then appear in the terminal emulator:
   Enter h or ? for help.

   =>

3. Because the OS file is large, you can increase the speed of the download by changing the switch console and terminal emulator baud rates to a high speed. For Example:
   a. Change the switch baud rate to 115,200 Bps.
      => sp 115200
   b. Change the terminal emulator baud rate to match the switch speed:
      I. In HyperTerminal, select Call|Disconnect.
      II. Select File|Properties.
      III. Click on Configure.
      IV. Change the baud rate to 115200.
      V. Click on [OK], then in the next window, click on [OK] again.
      VI. Select Call|Connect.
      VII. Press [Enter] one or more times to display the => prompt.

4. Start the Console Download utility by entering do at the => prompt and pressing [Enter]:
   => do
5. You then see this prompt:
   You have invoked the console download utility.
   Do you wish to continue? (Y/N)>_

6. At the above prompt:
   a. Enter y (for Yes)
   b. Select Transfer|File in HyperTerminal.
   c. Enter the appropriate filename and path for the OS image.
   d. Select the Xmodem protocol (and not the 1k Xmodem protocol).
   e. Click on [Send].

If you are using HyperTerminal, you will see a screen similar to the following to indicate that the download is in progress:

Figure 96: Example of Xmodem download in progress

![Xmodem file send for Terminal](image)

When the download completes, the switch reboots from primary flash using the OS image you downloaded in the preceding steps, plus the most recent startup-config file.

DNS resolver

The domain name system (DNS) resolver is designed for use in local network domains, where it enables the use of a host name or fully qualified domain name with DNS-compatible switch CLI commands.

DNS operation supports both IPv4 and IPv6 DNS resolution and multiple, prioritized DNS servers. (For information on IPv6 DNS resolution, see the latest IPv6 configuration guide for your switch.)

Basic operation

- When the switch is configured with only the IP address of a DNS server available to the switch, a DNS-compatible command, executed with a fully qualified domain name, can reach a device found in any domain accessible through the configured DNS server.
- When the switch is configured with both of the following:
- The IP address of a DNS server available to the switch
- The domain suffix of a domain available to the configured DNS server
then:
- A DNS-compatible command that includes the host name of a device in the same domain as the configured
domain suffix can reach that device.
- A DNS-compatible command that includes a fully qualified domain name can reach a device in any domain
that is available to the configured DNS server.

Example:

Suppose the switch is configured with the domain suffix mygroup.Switch.net and the IP address for an
accessible DNS server. If an operator wants to use the switch to ping a target host in this domain by using the
DNS name "leader" (assigned by a DNS server to an IP address used in that domain), the operator can use either
of the following commands:

Figure 97: Example: of using either a host name or a fully qualified domain name

```
Switch# ping leader
10.28.229.220 is alive, time = 1 ms
Switch# ping leader.mygroup.Switch.net
10.28.229.220 is alive, time = 1 ms
```

In the proceeding Example:, if the DNS server's IP address is configured on the switch, but a domain suffix is
either not configured or is configured for a different domain than the target host, the fully qualified domain name
must be used.

Note that if the target host is in a domain other than the domain configured on the switch:

- The host's domain must be reachable from the switch. This requires that the DNS server for the switch must
be able to communicate with the DNS servers in the path to the domain in which the target host operates.
- The fully qualified domain name must be used, and the domain suffix must correspond to the domain in which
the target host operates, regardless of the domain suffix configured in the switch.

Example:

Suppose the switch is configured with the domain suffix mygroup.Switch.net and the IP address for an
accessible DNS server in this same domain. This time, the operator wants to use the switch to trace the route to a
host named "remote-01" in a different domain named common.group.net. Assuming this second domain is
accessible to the DNS server already configured on the switch, a traceroute command using the target's fully
qualified DNS name should succeed.

Figure 98: Example: using the fully qualified domain name for an accessible target in another domain

```
Switch# traceroute remote-01.common.group.net
Traceroute to 10.22.240.73 (10.22.240.73), 30 hops max, 4 sec. timeout, 3 probes
1 10.28.229.3 0 ms 0 ms 0 ms
2 10.71.217.1 0 ms 0 ms 0 ms
3 10.0.198.2 1 ms 0 ms 0 ms
10.22.240.73 0 ms 0 ms 0 ms
```

Chapter 13 Troubleshooting 531
Configuring and using DNS resolution with DNS-compatible commands

The DNS-compatible commands include ping and traceroute.

Procedure

1. Determine the following:
   a. The IP address for a DNS server operating in a domain in your network.
   b. The priority (1 to 3) of the selected server, relative to other DNS servers in the domain.
   c. The domain name for an accessible domain in which there are hosts you want to reach with a DNS-compatible command. (This is the domain suffix in the fully qualified domain name for a given host operating in the selected domain. See Basic operation on page 530.) Note that if a domain suffix is not configured, fully qualified domain names can be used to resolve DNS-compatible commands.
   d. The host names assigned to target IP addresses in the DNS server for the specified domain.

2. Use the data from the first three bullets in step1 to configure the DNS entry on the switch.

3. Use a DNS-compatible command with the host name to reach the target devices.

Configuring a DNS entry

The switch allows up to two DNS server entries (IP addresses for DNS servers). One domain suffix can also be configured to support resolution of DNS names in that domain by using a host name only. Including the domain suffix enables the use of DNS-compatible commands with a target's host name instead of the target's fully qualified domain name.

Syntax:

```
[no] ip dns server-address priority <1-3> <ip-addr>
```

Configures the access priority and IP address of a DNS server accessible to the switch. These settings specify:

- The relative priority of the DNS server when multiple servers are configured
- The IP address of the DNS server

These settings must be configured before a DNS-compatible command can be executed with host name criteria.

The switch supports two prioritized DNS server entries. Configuring another IP address for a priority that has already been assigned to an IP address is not allowed.

To replace one IP address at a given priority level with another address having the same priority, you must first use the no form of the command to remove the unwanted address. Also, only one instance of a given server address is allowed in the server list. Attempting to enter a duplicate of an existing entry at a different priority level is not allowed.

To change the priority of an existing server address, use the no form of the command to remove the entry, then re-enter the address with the new priority.

The no form of the command replaces the configured IP address with the null setting. (Default: null)

Syntax:

```
[no] ip dns domain-name <domain-name-suffix>
```
This optional DNS command configures the domain suffix that is automatically appended to the host name entered with a DNS-compatible command. When the domain suffix and the IP address for a DNS server that can access that domain are both configured on the switch, you can execute a DNS-compatible command using only the host name of the desired target. (For an Example:, see Example: of using either a host name or a fully qualified domain name.) In either of the following two instances, you must manually provide the domain identification by using a fully qualified DNS name with a DNS-compatible command:

- If the DNS server IP address is configured on the switch, but the domain suffix is not configured (null).
- The domain suffix configured on the switch is not the domain in which the target host exists.

The switch supports one domain suffix entry and three DNS server IP address entries. (See the preceding command description.)

The **no** form of the command replaces the configured domain suffix with the null setting. (Default: null)

**Using DNS names with ping and traceroute: Example:**

In the network illustrated in Figure 99: Example: network domain on page 533, the switch at 10.28.192.1 is configured to use DNS names for DNS-compatible commands in the **pubs.outdoors.com** domain. The DNS server has been configured to assign the host name **docservr** to the IP address used by the document server (10.28.229.219).

**Figure 99: Example: network domain**

<table>
<thead>
<tr>
<th>Entity</th>
<th>Identity</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS server IP address</td>
<td>10.28.229.10</td>
</tr>
<tr>
<td>Domain name (and domain suffix for hosts in the domain)</td>
<td>pubs.outdoors.com</td>
</tr>
<tr>
<td>Host name assigned to 10.28.229.219 by the DNS server</td>
<td>docservr</td>
</tr>
<tr>
<td>Fully qualified domain name for the IP address used by the document server (10.28.229.219)</td>
<td>docservr.pubs.outdoors.com</td>
</tr>
</tbody>
</table>

Configuring switch "A" with the domain name and the IP address of a DNS server for the domain enables the switch to use host names assigned to IP addresses in the domain to perform **ping** and **traceroute** actions on the devices in the domain. To summarize:
With the above already configured, the following commands enable a DNS-compatible command with the host name `docserver` to reach the document server at 10.28.229.219.

### Configuring switch "A" in Example: network domain to support DNS resolution

```bash
switch(config)# ip dns server-address 10.28.229.10
switch(config)# ip dns domain-name pbs.outdoors.com
```

### Ping and traceroute execution for the network in Example: network domain

```bash
switch(config)# ping docservr
10.28.229.219 is alive, time = 1 ms

switch# traceroute docservr
traceroute to 10.28.229.219
   1 hop min, 30 hops max, 5 sec. timeout, 3 probes
   1 10.28.192.2 1 1 ms 0 ms 0 ms
   2 10.28.229.219 2 0 ms 0 ms 0 ms
```

- **1** First-Hop Router ("B")
- **2** Traceroute Target

As mentioned under the following example, if the DNS entry configured in the switch does not include the domain suffix for the desired target, you must use the target host's fully qualified domain name with DNS-compatible commands. For example, using the document server in Figure 99: Example: network domain on page 533 as a target:

**Figure 100: Example: of ping and traceroute execution when only the DNS server IP address is configured**

```bash
Switch# ping docservr.pubs.outdoors.com
10.28.229.219 is alive, time = 1 ms

Switch# traceroute docservr.pubs.outdoors.com
traceroute to 10.28.229.219
   1 hop min, 30 hops max, 5 sec. timeout, 3 probes
   1 10.28.192.2 1 ms 0 ms 0 ms
   2 10.28.229.219 0 ms 0 ms 0 ms
```
Viewing the current DNS configuration

The `show ip` command displays the current domain suffix and the IP address of the highest priority DNS server configured on the switch, along with other IP configuration information. If the switch configuration currently includes a non-default (non-null) DNS entry, it will also appear in the `show run` command output.

**Figure 101: Example of viewing the current DNS configuration**

<table>
<thead>
<tr>
<th>Switch# show ip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet (IP) Service</td>
</tr>
<tr>
<td>IP Routing : Disabled</td>
</tr>
<tr>
<td>Default Gateway : 10.28.192.2</td>
</tr>
<tr>
<td>Default TTL : 64</td>
</tr>
<tr>
<td>Arp Age : 20</td>
</tr>
<tr>
<td>Domain Suffix : pubs.outdoors.com</td>
</tr>
<tr>
<td>DNS server : 10.28.229.10</td>
</tr>
<tr>
<td>VLAN</td>
</tr>
<tr>
<td>DEFAULT_VLAN</td>
</tr>
</tbody>
</table>

Operating notes

- Configuring another IP address for a priority that has already been assigned to an IP address is not allowed. To replace one IP address at a given priority level with another address having the same priority, you must first use the no form of the command to remove the unwanted address. Also, only one instance of a given server address is allowed in the server list. Attempting to enter a duplicate of an existing entry at a different priority level is not allowed. To change the priority of an existing server address, use the no form of the command to remove the entry, then re-enter the address with the new priority.

- To change the position of an address already configured with priority `x`, you must first use `no ip dns server-address priority x <ip-addr>` to remove the address from the configuration, then use `ip dns server-address priority <ip-addr>` to reconfigure the address with the new priority. Also, if the priority to which you want to move an address is already used in the configuration for another address, you must first use the no form of the command to remove the current address from the target priority.

- The DNS servers and domain configured on the switch must be accessible to the switch, but it is not necessary for any intermediate devices between the switch and the DNS server to be configured to support DNS operation.

- When multiple DNS servers are configured on the switch, they can reside in the same domain or different domains.

- A DNS configuration must include the IP address for a DNS server that is able to resolve host names for the desired domain. If a DNS server has limited knowledge of other domains, its ability to resolve DNS-compatible command requests is also limited.

- If the DNS configuration includes a DNS server IP address but does not also include a domain suffix, then any DNS-compatible commands should include the target host’s fully qualified domain name.

- Switch-Initiated DNS packets go out through the VLAN having the best route to the DNS server, even if a Management VLAN has been configured.

- The DNS server address must be manually input. It is not automatically determined via DHCP.
Event Log messages

Please see the Event Log Message Reference Guide for information about Event Log messages.

Locating a switch (Locator LED)

To locate where a particular switch is physically installed, use the \texttt{chassislocate} command to activate the blue Locator LED on the switch's front panel.

Syntax:

\begin{verbatim}
chassislocate [blink | on | off]
\end{verbatim}

Locates a switch by using the blue Locate LED on the front panel.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>blink</td>
<td>Blinks the chassis Locate LED for a specified number of minutes (Default: 30 minutes).</td>
</tr>
<tr>
<td>on</td>
<td>Turns the chassis Locate LED on for a specified number of minutes (Default: 30 minutes).</td>
</tr>
<tr>
<td>off</td>
<td>Turns the chassis Locate LED off.</td>
</tr>
</tbody>
</table>

Locating a switch with the \texttt{chassislocate} command

\begin{verbatim}
switch(config)# chassislocate
blink <1-1440>    Blink the chassis locate led (default 30 minutes).
off               Turn the chassis locate led off.
on <1-1440>       Turn the chassis locate led on (default 30 minutes).
switch(config)# chassislocate
\end{verbatim}

For redundant management systems, if the active management module failover, the Locator LED does not remain lit.
Job Scheduler

The Job Scheduler feature enables the user to schedule commands or jobs on the switch for one time or multiple times. This is similar in concept to the UNIX ‘cron’ utility. The user can schedule any CLI command that the user would otherwise enter interactively. This includes commands to enable or disable ports, LEDs, and Power-Over-Ethernet. Jobs can also be scheduled to be triggered by certain pre-defined events such as switch reboot. The only major restriction on commands scheduled is that, it should not prompt/ask for any user inputs.

Commands

**Job at | delay | enable | disable**

Set schedule jobs using the options and set the count for the number of times the job is repeated.

**Syntax**

```
job JOB NAME at | delay | enable | disable
```

**Description**

Schedule a command to run automatically. Jobs can be scheduled to run once, multiple times on a recurring basis, or after certain events such as reboots. All commands run with manager privilege in configuration context.

The [no] form of the command deletes a scheduled job.

By default, jobs will be repeated an infinite number of times.

**Restrictions**

Jobs scheduled at any event will not be counted.

Jobs that are scheduled at the event “reboot” will not work in some multi management switches.

**Range**

- `<1-1000>`: is the value range for the `count` option.
- `([DD:]HH:)MM)`: is the format used for the specific delay.

**Options**

- `count`
  Specify the number of times the job should run.
- `delay`
  Specify the delay before running the job.
- `enable`
  Enable a job that is disabled or expired.
- `disable`
  Disable a job. By default, a job is enabled.
Usage

job <JOB NAME> at <([DD:]HH:]MM on <WEEKDAY-LIST)> config-save <COMMAND> count <1-1000>

job <JOB NAME> at <[HH:]MM on [MM/]DD> config-save <COMMAND> count <1-1000>

job <JOB NAME> at <EVENT> config-save <COMMAND>

job <JOB NAME> delay <([DD:]HH:]MM> config-save <COMMAND> count <1-1000>

job <JOB NAME> enable | disable

[no] job <JOB NAME>

Show job

Syntax

show job

Description

Show the jobs scheduled.

Show job

switch# show job

Job Scheduler Status and Configuration

NOTE: Caution

The scheduler does not run until the system time is set.

Show job <Name>

Syntax

show job JOB NAME

Description

Show the job by name.
show job <JOB NAME>

switch# show job a1

Job Information

Job Name    : a1
Runs At     : 01:24
Config Save : No
Repeat Count: --
Job Status   : Enabled
Run Count   : 1
Error Count : 0
Command     : show time
Job Status   : Enabled

Output from Last Run
---------------------
Tue Dec 15 01:24:00 2015

switch# show job a2

Job Information

Job Name    : a2
Runs At     : Every 2:14:30 days
Config Save : Yes
Repeat Count: 75
Run Count   : 0
Error Count : 0
Command     : vlan 3
Job Status   : Disabled

switch# show job foo

Job Information

Job Name    : foo
Runs At     : 17:00 SxTWTxS
Config Save : Yes
Repeat Count: --
Run Count   : 0
Error Count : 0
Command     : savepower led
Job Status   : Enabled
Overview

The traditional way of restoring a configuration from a backup configuration file required a switch reboot for the new configurations to be effective. There were network outages and a planned downtime for even minor changes. The switch configuration can now be restored from a backup configuration without reboot. It also provides hash of the current running configuration, which can be used for auditing.

The backup configuration can be created using the new command `cfg-backup`. An existing method of copying a configuration file from a remote location (for example, TFTP server) can also be used to backup a configuration or copied from flash.

More information
- `show hash` on page 560
- `cfg-backup` on page 544
- `cfg-restore config_bkp` on page 553

Benefits of configuration restore without reboot

- Restores a new or modified configuration without reboot, with minimal network outage. Any NMS can use this method for configuration rebase workflows. Only configurations that were exported from the switch can be imported or restored on the switch.
- Restores the configuration without reboot from a backup configuration when the running configuration has functional issues, like misconfigurations from remote management stations.

Recommended scenarios

- Use the configuration restore feature for incremental configuration updates.
- Use the `force` option with `cfg-restore`, for commands which require reboot.
- Use the `verbose` option to get detailed progress on the configuration restore process.

More information
- Force configuration restore on page 548
- `cfg-restore verbose` on page 552

Use cases

- A user can switch to a new configuration without rebooting the switch.
- If a user loses connectivity after applying the new configuration, a job scheduler executes the job after a specific time frame. This restores the current configuration to the switch, without rebooting it.

More information
- Switching to a new configuration on page 541
- Rolling back to a stable configuration using job scheduler on page 542
Switching to a new configuration

Procedure

1. Back up the configuration using `cfg-backup running-config config <config_name>` command. In the following example, the configuration name used is “stable”.
   ```
cfg-backup running-config config stable
   ```

2. Check the backup configuration using `show config files` command.
   ```
switch(config)# show config files
Configuration files:
   id | act pri sec | name
-------+-----------+--------
   1 |   *   *   * | config
   2 |           | stable
   3 |           |
   4 |           |
   5 |           |
   ```

3. Change the running configuration as required, and backup the new configuration as “newfile”.
   ```
cfg-backup running-config config newfile
   ```

4. Check the difference between the “newfile” (running configuration) and “stable” (backed up configuration) using `cfg-restore flash stable diff` command. Based on the difference, apply the backed-up configuration using `cfg-restore flash stable` command.

5. Check the status of the configuration restore using `show cfg-restore status` command.
   ```
switch(config)# show cfg-restore status
                    Status              : Success
Config File Name   : stable
Source             : Flash
Time Taken         : 3 Seconds
Last Run           : Tue Nov 28 18:24:09 2017
Recovery Mode      : Enabled
Failure Reason     : -
Number of Add Commands : 14
Number of Remove Commands : 0
Time Taken for Each Phase :
Calculating diff   : 1 Seconds
   ```
Rolling back to a stable configuration using job scheduler

Procedure

1. Configure the job using alias with the required configuration.

   alias <name> <command-list>
   job <name> delay [[DD:]HH:]MM <command>

   To schedule a job execution with cfg-restore operation once after 15 minutes (00:00:15):

   alias "cfg_rollback" "cfg-restore flash stable"
   job "cfg_stable" delay 00:00:15 "cfg_rollback" count 1

2. Back up the current stable configuration using the command cfg-backup running-config config <config_name>.

   cfg-backup running-config config stable

3. Check the backup configuration using the command show config files.

   switch(config)# show config files

   Configuration files:

   id | act pri sec | name
   ----+-------------+-------
   1  | * * * | config
   2  |         | stable
   3  |         |
   4  |         |
   5  |         |

4. Edit the configuration as needed. If the user is still connected to the switch, the configuration is stable and the job which reloads the older configuration can be cancelled using the command no job cfg_stable.

   switch(config)# no job cfg_stable

5. If the user loses connectivity after applying the new configuration, the job scheduler executes the job after the 15-minute timer expires, and “stable” configuration is restored. Use the following commands to check the output:

   • switch(config)# show job cfg_stable
   • switch(config)# show cfg-restore status

   switch(config)# show job cfg_stable

   Job Information

   Job Name : cfg_stable
   Runs At : Every 00:00:15 days:hours:minutes
   Config Save : No
   Repeat Count : 1
   Job Status : Enabled
   Running Status : Active
Run Count : 0
Error Count : 0
Skip Count : 0
Command : cfg_rollback

switch(config)# show cfg-restore status
Status : Success
Config File Name : stable
Source : Flash
Time Taken : 9 Seconds
Last Run : Tue Nov 28 20:50:00 2017
Recovery Mode : Enabled
Failure Reason : -
Number of Add Commands : 27
Number of Remove Commands : 0
Time Taken for Each Phase :
Calculating diff : 4 Seconds
Adding commands : 1 Seconds
Removing commands : 0 Seconds

NOTE: If the configuration involves any sensitive information, backup and restore the configuration by enabling the include-credentials command.

Commands used in switch configuration restore without reboot

 cfg-backup
  Backs up the selected configuration to the flash file.

 show config files details
  Shows a detailed list of configuration files available in the flash.

 cfg-restore
  Restores the given configuration as the running configuration without reboot.

 show cfg-restore status
  Shows the status of latest restore performed.

 show cfg-restore latest-diff
  Views the list of configuration changes that are removed, modified, or added to the running configuration.

 show hash
  Shows the SHA ID of a startup or running configuration.

 Configuration backup

 The configuration backup creates a backup of the running or startup configuration of ArubaOS-Switch on-demand to the flash storage on the switch. The maximum number of backup files supported has increased from three to five.

 NOTE: When you down grade configuration backup files from five to three, and if the current number of files is either a four or five, an error message Configuration file <name> stored in config index 5 is not supported in lower image versions is displayed.
**cfg-backup**

**Syntax**

cfg-backup {running-config | startup-config} config <FILE-NAME>

**Description**

Backs up the selected configuration to the flash file mentioned. When the firmware is downgraded to lower versions, the details of only three configuration files appear in the show config files command.

**Command context**

config

**Parameters**

running-config

Copies the running configuration to switch flash file.

startup-config

Copies the startup configuration to switch flash file.

flash

Name of the configuration file in flash.

**Usage**

`copy {startup-config | running-config} {sftp | tftp} <server address> <FILE-NAME>`

The existing `copy` command copies the startup and running configuration to the TFTP or SFTP server.

**Examples**

```
switch(config)# cfg-backup
running-config       Backup the running configuration to the flash file mentioned.
startup-config       Backup the startup configuration to the flash file mentioned.

switch(config)# cfg-backup {running-config | startup-config} config
config                Backup the named configuration file.

ASCII-STR             Enter an ASCII string.
```

**show config files**

**Syntax**

show config files

**Description**

Shows a list of configuration files available in the flash.

**Command context**

config
Examples

switch# show config files
Configuration files:

<table>
<thead>
<tr>
<th>id</th>
<th>act pri sec</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>*   *   *</td>
<td>config</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>add</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>modify</td>
</tr>
<tr>
<td>4</td>
<td></td>
<td>golden_config</td>
</tr>
<tr>
<td>5</td>
<td></td>
<td>poe2</td>
</tr>
</tbody>
</table>

To show the details of saved configuration files:

switch(config)# show config files
details        Show details of saved configuration files.

switch(config)# show config files details

Backup Configuration files:

vlan 200
  name "VLAN200"
  untagged 6-10

Chapter 15 Configuration backup and restore without reboot
Configuration restore without reboot

The `cfg-restore without reboot` command restores the configuration without reboot from a backup configuration to the running configuration of the switch.

The details about the difference between a running and a backup configuration can be displayed using `cfg-restore {flash | tftp | sftp} <FILE-NAME> diff` command.

More information
- Configuration backup on page 543
- Viewing the differences between a running configuration and a backup configuration on page 558

**cfg-restore**

**Syntax**

`cfg-restore {flash | tftp <IP-ADDRESS> | sftp <IP-ADDRESS>} <FILE-NAME> [diff | force | non-blocking | recovery-mode | verbose]

**Description**

Restores the given configuration as the running configuration without reboot. If the configuration is not suitable to successfully restore without reboot, the command will return a failure message with details.

**NOTE:** The restored configuration commands will be executed on a running configuration, so the name of the current active configuration does not change after configuration restore, except for the `force` option.

**Command context**

`config`

**Parameters**

- `flash`
  - Copies file from flash.
- `tftp`
  - Copies file from TFTP server.
- `sftp`
  - Copies file from SFTP server.
- `<IP-ADDRESS>`
  - IP address of the TFTP server.
- `<FILE-NAME>`
  - Name of the backup configuration file to restore into the running configuration.
- `diff`
  - Provides the list of changes that will be applied on the running configuration.
**force**
Forces a reboot if configuration in restored configuration requires a reboot. Applies the configuration with reboot if the configuration has reboot required commands or system-wide change commands. After a forced reboot, the name of the configuration changes.

**non-blocking**
Configuration restoration in non-blocking mode, where actual process happens in the background.

**recovery-mode**
Enables or disables recovery-mode. Recovery-mode is enabled by default and this retains the current running configuration if configuration restoration fails.

**verbose**
Provides the details of configuration restore status and the list of commands to be added or deleted.

**Usage**

- `cfg-restore flash <FILE-NAME> [non-blocking | diff | force | recovery-mode{enable | disable}] | [verbose [force | [recovery-mode{enable | disable}] | [diff | force]
- `cfg-restore tftp {<IPV4-ADDR> | <IPV6-ADDR> | <HOSTNAME-STR> <FILE-NAME> [non-blocking | diff | force | recovery-mode{enable | disable}] | [verbose [force | [recovery-mode{enable | disable}] | [diff | force]
- `cfg-restore sftp {<IPV4-ADDR> | <IPV6-ADDR> | <HOSTNAME-STR> | user <name> {<IP-ADDRESS|IPV6-ADDRESS|HOSTNAME-STR> | <USERNAME@>{<HOST-NAME | <IPV4-ADDR> | <IPV6-ADDR>}} [port <1-65535>] <FILE-NAME> [non-blocking | diff | force | recovery-mode{enable | disable}] | [verbose [force | [recovery-mode{enable | disable}] | [diff | force]

**Examples**

```
switch# cfg-restore flash
 flash Copy file from flash.
sftp Copy file from SFTP Server.
tftp Copy file from TFTP Server.

switch# cfg-restore flash
FILE-NAME Name of the backup configuration file to restore into the running configuration.

diff flash config_file
 diff Provide the list of changes that will be applied on the running configuration.

force flash config_file
 force Apply the configuration with reboot if the configuration has reboot required commands or system-wide change commands present.

non-blocking flash config_file
 non-blocking To enable/disable recovery-mode.

recovery-mode flash config_file
 recovery-mode To enable/disable recovery-mode.

verbose flash config_file
 verbose Provide the details of config restore status and the list of commands to be added or deleted.
```

```
switch# cfg-restore tftp
 HOSTNAME-STR Specify hostname of TFTP Server.
IP-ADDR IP Address of the TFTP Server.
IPV6-ADDR IPV6 Address of the TFTP Server.

switch# cfg-restore tftp 10.100.0.12
 FILE-NAME Name of the backup configuration file to restore into the running configuration.

diff tftp 10.100.0.12 config_file
 diff Provide the list of changes that will be applied on the running configuration.

force tftp 10.100.0.12 config_file
 force Apply the configuration with reboot if the configuration has reboot required commands or
```
Force configuration restore

The `cfg-restore` command fails if a reboot is required. The configuration restoration is not allowed as the configuration has reboot required commands error is displayed, along with lines requiring a reboot. The force option in the `cfg-restore` command allows a user to force a reboot. The command is: `cfg-restore {flash | tftp | sftp} <FILE-NAME> force`.

Before reboot, `config` is the active configuration. After the device reboots, the backup file becomes the new active configuration.

```
switch(config)# show cfg-restore status
Status : Failed
Config File Name : golden_config
Source : Flash
Time Taken : 5 Seconds
Last Run : Mon Oct 30 23:03:19 2017
Recovery Mode : Enabled
Failure Reason : Reboot required commands present.
Command : console terminal none
Number of Add Commands : 0
Number of Remove Commands : 1
Time Taken for Each Phase :
  Calculating diff : 3 Seconds
  Adding commands : 0 Seconds
  Removing commands : 0 Seconds
```

```
switch# cfg-restore flash golden_config force
Device may be rebooted if the configuration file has reboot required or system-wide change commands. Do you want to continue (y/n)?
Current running-configuration will be replaced with 'golden_config'. Continue (y/n)?
Configuration restore is in progress, configuration changes are temporarily disabled.
Successfully applied configuration 'golden_config' to running configuration.
Rebooting switch...
```
In the preceding output, `Command : console terminal none` shows that `cfg-restore` failed because a reboot is required.

After the switch reboots and comes up, the `golden_config` becomes the active configuration.

NOTE: In case of a switch reboot, the switch comes up with the configuration associated with the primary or secondary.

| id | act pri sec | name     |
|----+-------------+-----------|
| 1  | * *         | config    |
| 2  |             | def       |
| 3  | *           | golden_config |
| 4  |             |           |
| 5  |             |           |

switch# show cfg-restore status
Status : Success
Config File Name : default
Source : Flash
Time Taken : 1 Seconds
Last Run : Mon Oct 23 07:17:03 2017

Recovery Mode : Enabled
Failure Reason : -
Number of Add Commands : 0
Number of Remove Commands : 5

Time Taken for Each Phase :
Calculating diff : 1 Seconds
Adding commands : 0 Seconds
Removing commands : 0 Seconds

NOTE: Time taken for adding and deleting commands is zero, as the switch reboots. It is similar to downloading a startup-configuration to the device.

cfg-restore non-blocking

Syntax
`cfg-restore {flash | tftp | sftp} <FILE-NAME> non-blocking`

Description
Performs restore in non-blocking mode.

Command context
cfg

Example
```
switch(config)# cfg-restore flash add non-blocking
Current running-configuration will be replaced with 'add'.
Continue (y/n)? y
Configuration restore is in progress, configuration changes are
temporarily disabled.
switch(config)#
```
switch(config)# show cfg-restore status
Status : Success
Config File Name : add
Source : Flash
Time Taken : 2 Seconds
Last Run : Sun Oct 22 22:09:02 2017

Recovery Mode : Enabled
Failure Reason : -

Number of Add Commands : 7
Number of Remove Commands : 10

Time Taken for Each Phase :
  Calculating diff : 1 Seconds
  Adding commands : 0 Seconds
  Removing commands : 0 Seconds

cfg-restore recovery-mode

Syntax

cfg-restore {flash | tftp | sftp} <FILE-NAME> recovery-mode {enable | disable}

Description

Restores the current running configuration, if a restore to the backup configuration fails. By default, recovery-mode is enabled.

Command context

config

Usage

To disable recovery mode, use `cfg-restore {flash | tftp | sftp} <FILE-NAME> recovery-mode disable`.

Example

With the following running configuration, a restore to the backup file `modify` fails, but this configuration will be retained as recovery mode is enabled.

switch(config)# show running-config

Running configuration:

; JL255A Configuration Editor; Created on release #WC.16.05.0000x
; Ver #12:08.1d.9b.3f.bf.bb.ef.7c.59.fc.6b.fb.9f.fc.ff.ff.37.ef:ba
hostname "Aruba-2930F-24G-PoEP-4SPPP"
module 1 type jl255a
ip routing

cfg-restore config_bkp

**Syntax**

cfg-restore {tftp <ip-address> | sftp <ip-address>} config_bkp

**Description**

Downloads and restores a configuration from the TFTP or SFTP server, without rebooting the switch.

**NOTE:** The commands from the restored configuration will be executed on the running configuration. The name of the current active configuration will not change after a configuration restore.

**Command context**

config

**Example**

switch(config)# cfg-restore tftp
HOSTNAME-STR Specify hostname of TFTP Server.
IP-ADDR IP Address of the TFTP Server.
IPV6-ADDR IPv6 Address of the TFTP Server.

switch(config)# cfg-restore sftp
HOSTNAME-STR Specify hostname of the SFTP server.
IP-ADDR IP Address of the SFTP Server.
IPV6-ADDR IPv6 Address of the SFTP Server.
user Specify username on the remote system information
USER@IP-STR Specify username along with remote system information

switch(config)# cfg-restore tftp 10.100.0.12 pvos/tftp_2930_config_file
Current running-configuration will be replaced with 'tftp_2930_config_file'.
Continue (y/n)? y
Configuration restore is in progress, configuration changes are temporarily disabled.

Successfully applied configuration 'tftp_2930_config_file' to running configuration.

switch(config)# sh cfg-restore status
Status : Success
Config File Name : tftp_2930_config_file
Source : TFTP
Time Taken : 4 Seconds
Last Run : Wed Nov 8 21:11:10 2017

Recovery Mode : Enabled
Failure Reason : -

Number of Add Commands : 4
Number of Remove Commands : 7

Chapter 15 Configuration backup and restore without reboot
Time Taken for Each Phase:
- Calculating diff: 1 Seconds
- Adding commands: 0 Seconds
- Removing commands: 0 Seconds

switch(config)# show config files

Configuration files:

<table>
<thead>
<tr>
<th>id</th>
<th>act</th>
<th>pri</th>
<th>sec</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>*</td>
<td>*</td>
<td>*</td>
<td>config</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Configuration restore with force option**

**Prerequisites**
Back up the configuration using traditional `copy config` or `cfg-backup` commands.

**Procedure**

1. Execute the `show config files` command. By default, the `config` file provides all the associations.

   ```
   switch(config)# show config files
   Configuration files:
<table>
<thead>
<tr>
<th>id</th>
<th>act</th>
<th>pri</th>
<th>sec</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>*</td>
<td>*</td>
<td>*</td>
<td>config</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
   ```

2. Use `cfg-restore flash file1 force` command to see the configuration of file1.

   ```
   switch(config)# cfg-restore flash file1 force
   As the file1 configuration requires a reboot, a system reboot occurs. When the switch comes up, file1 is the new active configuration.
   ```

   ```
   switch(config)# sh config files
   Configuration files:
<table>
<thead>
<tr>
<th>id</th>
<th>act</th>
<th>pri</th>
<th>sec</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>*</td>
<td>*</td>
<td>*</td>
<td>config</td>
</tr>
<tr>
<td>2</td>
<td>*</td>
<td></td>
<td></td>
<td>file1</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td>file2</td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
   ```

**NOTE:** During a configuration restore with reboot, the association changes. To make the configuration as a default configuration for subsequent system reboots, use `startup-default [<primary|secondary>] config FILENAME` command.
For startup-default config file1:

```plaintext
switch(config)# show config files
Configuration files:

<table>
<thead>
<tr>
<th>id</th>
<th>act</th>
<th>pri</th>
<th>sec</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td>config</td>
</tr>
<tr>
<td>2</td>
<td>*</td>
<td>*</td>
<td>*</td>
<td>file1</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td>file2</td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**System reboot commands**

Following commands require a system reboot:

- secure-mode standard
- secure-mode enhanced
- mesh id [0-9]
- mesh [a-z | A-Z | 0-9]
- max-vlans <257-4094>
- no allow-v2-modules
- qinq (mixedvlan | svlan)
- qos queue-config
- terminal type (vt100 | ansi)
- console (flow-control | terminal)
- vsf member [0-9]
- vsf remove
- access-list grouping
- console baud-rate (speed-sense | 1200 | 2400 | 4800 | 9600 | 19200 | 38400 | 57600 | 115200)

**Systemwide change commands**

Following commands change the system configuration:

- module [0-9 | a-z | A-Z]
- module [0-9 | a-z | A-Z] type <type>
- igmp lookup-mode ip
- flexible-module [a-z | A-Z] type <type>
- stacking member [0-9] flexible-module [a-z | A-Z] type <type>
**Configuration restore without force option**

If the two configuration files backed up are file1 and file2:

**Prerequisites**
Backup the configuration using either the traditional `copy config` or the `cfg-backup` commands.

**Procedure**

1. Execute the `show config files` command. By default, the `config` file provides all the associations.

   ```
   switch(config)# show config files
   Configuration files:
   id | act pri sec | name
   ---+-------------+-------
   1 |  *   *   *  | config
   2 |             | file1
   3 |             | file2
   4 |             |
   5 |             |
   ```

2. Use `cfg-restore flash file1` command to see the configuration of file1.

   ```
   switch(config)# cfg-restore flash file1
   ```

   Even after executing the previous command, associations will remain the same, but the running configuration is replaced by file1 configuration.

   **NOTE:** In a configuration restore without reboot, the association remains the same. The default `config` file is updated based on the configuration of the restored file.

**show cfg-restore status**

**Syntax**

```
show cfg-restore status
```

**Description**

Shows the status of latest restore performed. The running configuration is updated based on the configuration of the restored file.

**Command context**

`config`

**Usage**

```
show cfg-restore {status | latest-diff}
```

This command provides information on:

- how a restore is performed
- whether a flash file was used from SFTP or TFTP server
- the total time taken to restore
- the time when last restore was initiated
• whether a recovery-mode was enabled
• the number of add and delete commands
• reboot commands present (if any), and
• the split time taken for each phase

Examples

```
switch(config)# show cfg-restore
latest-diff           Shows the difference between running and back-up
                      configuration.
status                  Show configuration restoration status.
```

```
switch(config)# show cfg-restore status
Status                  : [Failed| In progress | Success | Not Started]
Config File name        : def
Source                  : [-|Tftp|sftp|Flash|REST]
Time taken              : [-|20 Seconds.]
Last Run                : [-|Tue March 07 22:12:16 2017.]
Recovery Mode           : Enabled
Failure Reason          : -

Number of Add Commands : 0
Number of Remove Commands : 3

Time Taken for Each Phase :
  Calculating diff       : 1 Seconds
  Adding commands        : 0 Seconds
  Removing commands      : 0 Seconds
```

If the configuration restoration fails, the line number and the failed commands are displayed:

```
switch(config)# show cfg-restore status
Status                  : Failed
Config File name        : def
Source                  : Flash
Time taken              : 20 Seconds
Last Run                : Sun Oct 22 20:22:54 2017
Recovery Mode           : Enabled
Failure Reason          : Add commands have been failed

Number of Add Commands : 0
Number of Remove Commands : 3

Time Taken for Each Phase :
  Calculating diff       : 1 Seconds
  Adding commands        : 0 Seconds
  Removing commands      : 0 Seconds

Failed to remove commands:
  Line: 12 vlan 10
  Line: 15 no ipv6 nd snooping mac-check

Failed to add commands:
  Line: 10 icmp 10.100.0.12 source-inter vlan 1
  Line: 20 udp-echo 10.100.0.12 source vlan 1
```
NOTE: The number of add and delete commands is calculated excluding the `exit` commands in the configuration file.

Viewing the differences between a running configuration and a backup configuration

Prerequisites
Use the `cfg-restore {flash | tftp | sftp} <FILE-NAME> diff` command to view the list of configuration changes that are removed, modified, or added to the running configuration.

Procedure

1. Execute the `show running-config` command to show the running configuration of the switch.

```
switch(config)# show running-config
Running configuration:

; JL255A Configuration Editor; Created on release #WC.16.05.0000x
; Ver #12:08.1d.9b.3f.bf.bb.ef.7c.59.fc.6b.fb.9f.fc.ff.ff.37.ef:ba
hostname "Aruba-2930F-24G-PoEP-4SFPP"
module 1 type jl255a
snmp-server community "public" unrestricted
vlan 1
   name "DEFAULT_VLAN"
   no untagged 11-13,15-18
   untagged 1-10,14,19-28
   ip address dhcp-bootp
   exit
vlan 100
   name "VLAN100"
   untagged 11-13
   no ip address
   exit
vlan 300
   name "VLAN300"
   untagged 15-18
   no ip address
   exit
```

2. Execute the `show config golden_config` command to show the backup configuration of the switch.

```
switch(config)# show config golden_config
; JL255A Configuration Editor; Created on release #WC.16.05.0000x
; Ver #12:08.1d.9b.3f.bf.bb.ef.7c.59.fc.6b.fb.9f.fc.ff.ff.37.ef:ba
hostname "Aruba-2930F-24G-PoEP-4SFPP"
module 1 type jl255a
; JL255A Configuration Editor; Created on release #WC.16.05.0000x
; Ver #12:08.1d.9b.3f.bf.bb.ef.7c.59.fc.6b.fb.9f.fc.ff.ff.37.ef:ba
hostname "Aruba-2930F-24G-PoEP-4SFPP"
module 1 type jl255a
```

3. Execute the `cfg-restore flash golden_config diff` command to view the differences that will be applied.

```
switch# cfg-restore flash golden_config diff
```
Configuration delete list:

vlan 1
  no untagged 11-13,15-18
  untagged 3-10
  exit
vlan 100
  untagged 11-13
  exit
vlan 300
  name "VLAN300"
  untagged 15-18
  no ip address
  exit

Configuration add list:

vlan 1
  no untagged 3-10
  untagged 11-13,15-18
  exit
vlan 100
  untagged 3-5
  exit
vlan 200
  name "VLAN200"
  untagged 6-10
  no ip address
  exit

NOTE: If the running and the backup configuration is the same, no difference will be displayed.

switch(config)# cfg-restore flash modify diff

Current config and backup config is identical.

4. Execute the show cfg restore latest-diff command to display the difference between the running and the backup configuration.

switch(config)# show cfg-restore

latest-diff Shows the difference between running and back-up configuration.
status Show configuration restoration status.

switch(config)# show cfg-restore latest-diff

Configuration delete list:

ip default-gateway 172.20.0.1
vlan 100
  name "VLAN100"
  no ip address
  exit

Configuration add list:

vlan 10
  name "VLAN10"
  no ip address
Show commands to show the SHA of a configuration

The `show` commands provide SHA details of the running and startup configurations.

**show hash**

**Syntax**

```
show {config | running-config} hash {recalculate}
```

**Description**

Shows SHA ID of startup or running configuration.

**Command context**

`config`

**Examples**

```
switch# show config
config
files List saved configuration files.
hash Display the hash calculated for the startup configuration.
interface Show the startup configuration for interfaces.
oobm Show the startup configuration for OOBM.
```

To display the hash calculated for the startup configuration:

```
switch(config)# show config hash
The hash must be calculated. This may take several minutes.
Continue (y/n)? y
Calculating hash...
Startup Configuration hash:
4f66 8b77 6b66 e5fb 0c12 f7fb 8ea6 b548 af2e 2e03
```

This hash is only valid for comparison to a baseline hash if the configuration has not been explicitly changed (such as with a CLI command) or implicitly changed (such as by the removal of a hardware module).

```
switch(config)# show config hash recalculate
Calculate hash (if needed) without prompting.
switch(config)# show config hash recalculate
Startup Configuration hash:
4f66 8b77 6b66 e5fb 0c12 f7fb 8ea6 b548 af2e 2e03
```

This hash is only valid for comparison to a baseline hash if the configuration has not been explicitly changed (such as with a CLI command) or implicitly changed (such as by the removal of a hardware module).
To display the hash calculated for the running configuration:

```
switch(config)# show running-config hash
```
The hash must be calculated. This may take several minutes.

Continue (y/n)? y
Calculating hash...
Running configuration hash:

```
6d88 0880 98af e8a8 b564 15cd 368e 4269 9d61 4bfa
```
This hash is only valid for comparison to a baseline hash if the configuration has not been explicitly changed (such as with a CLI command) or implicitly changed (such as by the removal of a hardware module).

**Scenarios that block the configuration restoration process**

The configuration restoration process is blocked in the following scenarios:

- If the restored configuration file requires a reboot.
- If the restored configuration changes the entire configuration (for example, module add or remove).

**More information**

cfg-restore on page 546

**Troubleshooting and support**

Switch configuration restore without reboot feature provides CLI support to:

- display the number of commands with line number that failed to restore.
- display the delta between running configuration and the configuration to be restored.

**More information**

[Viewing the differences between a running configuration and a backup configuration](#) on page 558
[show cfg-restore status](#) on page 556

**debug cfg-restore**

**Syntax**

d.debug cfg-restore

**Description**

Debug logs display the commands executed by `cfg-restore`.

**Command context**

config and manager

**Example**

```
switch(config)# debug cfg-restore
switch(config)# debug destination buffer
switch(config)# show debug buffer
```
0000:01:39:51.58 CFG mCfgRestoreMgr:cfg-restore to config file "backup_conif" started.
0000:01:39:56.45 CFG mCfgRestoreMgr:cfg-restore diff calculated, number of commands to add =0 number of commands to delete = 3.
0000:01:39:56.45 CFG mCfgRestoreMgr:cfg-restore iteration count = 1.
0000:01:39:56.51 CFG mCfgRestoreMgr:Command executed = no vlan 2 tagged 9, Status = Success.
0000:01:39:56.51 CFG mCfgRestoreMgr:Command deleted = vlan 2 tagged 9.
0000:01:39:56.58 CFG mCfgRestoreMgr:Command executed = no vlan 3 tagged 9, Status = Success.
0000:01:39:56.58 CFG mCfgRestoreMgr:Command deleted = vlan 3 tagged 9.
0000:01:39:56.64 CFG mCfgRestoreMgr:Command executed = no vlan 4 tagged 9, Status = Success.
0000:01:39:56.64 CFG mCfgRestoreMgr:Command deleted = vlan 4 tagged 9.
0000:01:39:59.38 CFG mCfgRestoreMgr:Successfully applied configuration 'backup_conif' to running configuration.
** Total debug messages = 22
Virtual Technician is a set of tools aimed at aiding network switch administrators in diagnosing and caring for their networks. VT provides tools for switch diagnoses when faced with unforeseen issues.

To improve the Virtual Technician features of our devices have added the following tools:

- Cisco Discovery Protocol
- Enabling Debug tracing for MOCANA code
- User diagnostic crash via front panel security button
- User diagnostic crash via the serial console

### Cisco Discovery Protocol (CDP)

#### Show cdp traffic

**Syntax**

```
show cdp traffic
```

**Description**

Displays the number of Cisco Discovery Protocol (CDP) packets transmitted, received and dropped.

<table>
<thead>
<tr>
<th>Port No</th>
<th>Transmitted Frames</th>
<th>Received Frames</th>
<th>Discarded Frames</th>
<th>Error Frames</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>46</td>
<td>26</td>
<td>6</td>
<td>7</td>
</tr>
<tr>
<td>A2</td>
<td>30</td>
<td>35</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>A3</td>
<td>120</td>
<td>420</td>
<td>670</td>
<td>670</td>
</tr>
</tbody>
</table>

#### Clear cdp counters

**Syntax**

```
clear cdp counters
```

**Description**

Allows a user to clear CDP statistics.
**show cdp neighbors detail**

**Syntax**

show cdp neighbors detail

**Description**

Shows CDP neighbors on specified port only.

---

**show cdp neighbor detail**

CDP neighbors information

<table>
<thead>

</tbody>
</table>

---

**Enable/Disable debug tracing for MOCANA code**

**Debug security**

**Syntax**

debug security ssl

**Description**

Enables the debug tracing for MOCANA code. Use the [no] parameter to disable debug tracing.

ssl

Display all SSL messages.
User diagnostic crash via Front Panel Security (FPS) button

Allows the switch’s front panel Clear button to manually initiate a diagnostic reset. In the case of an application hang, this feature allows you to perform reliable diagnostics by debugging via the front panel Clear button. Diagnostic reset is controlled via Front Panel Security (FPS) options.

Front panel security password-clear

From the configure context:

Syntax

[no] front-panel-security password-clear <RESET-ON-CLEAR> | factory-reset | password-recovery | diagnostic-reset <CLEAR-BUTTON | SERIAL-CONSOLE>

Description

Enable the ability to clear the password(s) and/or configuration via the front panel buttons. [no] disables the password clear option.

Parameters

- If password-clear is disabled, the password(s) cannot be reset using the clear button on the front panel of the device.
- If factory-reset is disabled, the configuration/password(s) can not be reset using the clear and reset button combination at boot time.
- When password-recovery is enabled (and the front panel buttons disabled), a lost password can be recovered by contacting customer support.
- When password-recovery is disabled, there is no way to access a device after losing a password with the front panel buttons disabled.
- If diagnostic-reset is disabled, the user cannot perform a diagnostic switch reset on those rare events where the switch becomes unresponsive to user input because of unknown reason(s).
- If diagnostic-reset is enabled, the user can perform a diagnostic hard reset which will capture valuable diagnostic data and reset the switch.

Options

factory-reset
   Enable/Disable factory-reset ability.
password-clear
   Enable/Disable password clear.
password-recovery
   Enable/Disable password recovery.
diagnostic-reset
   Enable/Disable diagnostic reset.

Front-panel-security diagnostic-reset

From the configure context:
Syntax

front-panel-security diagnostic-reset <CLEAR-BUTTON | SERIAL-CONSOLE>

Description

Enables the diagnostic reset so that the switch can capture diagnostic data.

- To initiate diagnostic reset via the clear button, press the clear button for at least 30 seconds but not more than 40 seconds.
- To initiate diagnostic switch reset via the serial console, enter the diagnostic reset sequence on the serial console.

Options

Clear button

Enables the diagnostics by choosing the clear button option.

Serial console

Enables the diagnostics by choosing the serial console option.

[no] front-panel-security diagnostic-reset

From the configure context:

Syntax

[no] front-panel-security diagnostic-reset

Description

Disables the diagnostic reset feature so that the user is prevented from capturing diagnostic data and performing a diagnostic reset on the switch. Both the sub-options reset-via-serial-console and reset-via-clear-button will be disabled. This is necessary if the switch becomes unresponsive (hangs) for unknown reasons.

No front-panel-security diagnostic-reset

no front-panel-security diagnostic-reset

CAUTION:

Disabling the diagnostic reset prevents the switch from capturing diagnostic data on those rare events where the switch becomes unresponsive to user input because of unknown reasons. Ensure that you are familiar with the front panel security options before proceeding.

Front-panel-security diagnostic-reset clear-button

From the configure context:
Syntax

`front-panel-security diagnostic-reset clear-button`

Description
This command will enable diagnostic-reset via clear button. The user will be allowed to perform diagnostic reset by depressing the clear button for 30 seconds and not more than 40 seconds.

Front-panel-security diagnostic-rest clear-button

<table>
<thead>
<tr>
<th>Feature</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diagnostic Reset</td>
<td>Enabled</td>
</tr>
<tr>
<td>clear-button</td>
<td>Enabled</td>
</tr>
<tr>
<td>serial-console</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

**CAUTION:**
Disabling the diagnostic reset prevents the switch from capturing diagnostic data on those rare events where the switch becomes unresponsive to user input because of unknown reasons. Ensure that you are familiar with the front panel security options before proceeding.

[No] front-panel-security diagnostic-reset clear-button

From the configure context:

Syntax

`[no] front-panel-security diagnostic-reset clear-button`

Description
Disables the diagnostic-reset via clear button.

**CAUTION:**
Disabling the diagnostic reset prevents the switch from capturing diagnostic data on those rare events where the switch becomes unresponsive to user input because of unknown reasons. Ensure that you are familiar with the front panel security options before proceeding.

Show front-panel-security

Syntax

`show front-panel-security`

Options

Show front-panel-security

<table>
<thead>
<tr>
<th>Feature</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear Password</td>
<td>Enabled</td>
</tr>
<tr>
<td>Reset -on-clear</td>
<td>Disabled</td>
</tr>
<tr>
<td>Factory Reset</td>
<td>Enabled</td>
</tr>

</tr>
</tbody>
</table>

Chapter 16 Virtual Technician 567
**NOTE:**
By default, user initiated diagnostic reset is enabled.

## Diagnostic table

<table>
<thead>
<tr>
<th>To accomplish this</th>
<th>Do this</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soft Reset (Standalone switch)</td>
<td>Press and release the Reset button</td>
<td>The switch operating system is cleared gracefully (such as data transfer completion, temporary error conditions are cleared), then reboots and runs self tests.</td>
</tr>
<tr>
<td>Hard Reset (Standalone switch)</td>
<td>Press and hold the Reset button for more than 5 seconds (until all LEDs turn on), then release.</td>
<td>The switch reboots, similar to a power cycle. A hard reset is used, for example, when the switch CPU is in an unknown state or not responding.</td>
</tr>
<tr>
<td>Delete console and management access passwords</td>
<td>Press Clear for at least one second, but not longer than 5 seconds.</td>
<td>The switch deletes all access password.</td>
</tr>
<tr>
<td>Restore the factory default configuration</td>
<td>1. Press Clear and Reset simultaneously.</td>
<td>The switch removes all configuration changes, restores the factory default configuration, and runs self test.</td>
</tr>
<tr>
<td></td>
<td>2. While continuing to press Clear, release Reset.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>3. When the Test LED begins blinking (after approximately 25 seconds), release Clear.</td>
<td></td>
</tr>
<tr>
<td>Diagnostic reset</td>
<td>1. Press Clear to 30–40 seconds.</td>
<td>This initiates diagnostic reset, collects diagnostic information, and reboots the switch.</td>
</tr>
<tr>
<td></td>
<td>2. When the test LED begins blinking (approximately after 30 seconds), release Clear.</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE:** Releasing the Clear button when TEST LED is not blinking (approximately after 40 seconds) will not honor the diagnostic reset request.

**NOTE:** These buttons are provided for the user’s convenience. If switch security is a concern, ensure that the switch is installed in a secure location, such as a locked writing closet. To disable the buttons, use the `front-panel-security` command.
### Validation rules

<table>

<table>
<thead>
<tr>
<th>Event</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Console print</td>
<td>STKM: HA Sync in progress; user initiated diagnostic request via the serial console rejected. Retry after sometime. Printed on the device console. When standby is in sync state, we don’t want to crash the commander. So we report to the user to retry later.</td>
</tr>
<tr>
<td>Console print</td>
<td>STKM: Member is booting; user initiated diagnostic request via the serial console rejected. Retry after sometime. Printed on the device console. When the member is still booting, it doesn’t have the commander member number, thus we can’t issue UIDC on the commander. So we report to the user to retry later.</td>
</tr>
</tbody>
</table>

**User initiated diagnostic crash via the serial console**

Remotely triggers a diagnostic reset of the switch via a serial console. This reset reboots the switch and collects diagnostic data for debugging an application hang, a system hang or any other rare occurrence. Diagnostic reset is controlled via FPS options.

The serial sequence to initiate the User Initiated Diagnostic Reset via Serial console is Ctrl+S, Ctrl+T, Ctrl+Q, Ctrl+T, Ctrl+S.

**Front-panel-security diagnostic-reset serial-console**

In the configure context:

**Syntax**

```
front-panel-security diagnostic-reset serial-console
```

Enables the diagnostic-reset via serial console. Allows the user to perform diagnostic reset by keying-in diagnostic reset sequence.

```
front-panel-security diagnostic-reset serial-console
```

**Diagnostic Reset** - Enabled
**clear-button** - Disabled
**serial-console** - Enabled

**[No] front-panel-security diagnostic-reset serial-console**

In the configure context:

**Syntax**

```
[no] front-panel-security diagnostic-reset serial-console
```
Description
Disables the diagnostic-reset via serial console.

No front-panel-security diagnostic-reset serial-console

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no front-panel-security diagnostic-reset serial-console</td>
<td>Diagnostic Reset     - Disabled</td>
</tr>
</tbody>
</table>

**CAUTION:**
Disabling the diagnostic reset prevents the switch from capturing diagnostic data on those rare events where the switch becomes unresponsive to user input because of unknown reasons. Ensure that you are familiar with the front panel security options before proceeding.

Serial console error messages

<table>

Overview

IP Service Level Agreement (IP SLA) is a feature that helps administrators collect information about network performance in real time. With increasing pressure on maintaining agreed-upon Service Level Agreements on Enterprises and ISPs alike, IP SLA serves as a useful tool.

Any IP SLA test involves a source node and a destination node. For all discussions in this document, the source is always an ArubaOS-switch with IP SLA support. As shown in the diagram above, a destination can, in most cases, be any IP-enabled device. For some SLA types that expect a nonstandard response to a test packet, an “SLA responder” must be configured. An “SLA responder” is nothing but an ArubaOS-switch with IP SLA configurations on it that enable it to respond to the test packet.

The IP SLA feature provides:

- Application-aware monitoring that simulates actual protocol packets.
- Predictable measures that aid in ease of deployment and help with assessment of existing network performance.
- Accurate measures of delay and packet loss for time-sensitive applications.
- End-to-end measurements to represent actual user experience.

We support the following SLA types:

- UDP Echo, including connectivity testing of transport layer (UDP) services, Round-Trip-Time (RTT) measurement, one-way delay, and packet loss details.
- ICMP Echo, including connectivity testing, RTT measurement, and packet loss details.
- TCP Connect, including connectivity testing of transport layer (TCP) services, and handshake time measurement.
- DHCP, which measures the round-trip time taken to discover a DHCP Server and obtain a leased IP address from it.
• DNS, which measures the time taken for a DNS resolution. This measures the difference between the time taken to send a request to the DNS server and the time the IP SLA source receives a reply.
• User Datagram Protocol (UDP) Jitter, which measures RTT, one way jitter and one way delays.
• UDP Jitter for VoIP, which measures RTT, one way jitter, one way delays, ICPIF (Impairment Calculated Planning Impairment Factor) and MOS (Mean Opinion Score).

Limitations for IPSLA support on Aruba switches:
• IP SLA is not enabled for IPv6.
• DHCP SLA supports DHCPv4 only.
• IP SLA tests cannot be initiated over OOBM interfaces.
• History results for the configured IP SLAs will not be available after a switchover or a reboot.
• Maximum number of IP SLAs that can be configured varies based on the type of SLA test.
• When there are multiple IP SLAs configured with destination as hostname, the DNS resolution happens serially. There can be a delay in sending the test probe (which will be sent only after successful DNS resolution).
• For TCP Connect SLA type, the four-tuple (source IP/port, destination IP/port) must be unique.
• System clocks between the source and the responder must be synchronized with NTP if One Way Delay parameters have to be calculated for UDP Echo tests.
• Timeout for probes is 3 seconds for all SLA types and is not configurable.
• Transient spikes in RTT occur during the tests (in the source and the responder) if processor usage is high. Consider average result values over a period of time rather than point-in-time results. This is not applicable for UDP Jitter nor Jitter for VoIP.

<table>
<thead>
<tr>

<td>Maximum history bucket size per SLA.¹</td>
<td>50</td>
</tr>
<tr>
<td>Number of responders that can be configured.</td>
<td>10</td>
</tr>
</tbody>
</table>

¹ Not applicable for UDP Jitter and Jitter for VoIP.

The following are operational restrictions with respect to IP SLA jitter implementation:
• Feature is not supported on 2540.
• Feature is supported only on v3-based platforms (5400R, 3810, 2930F).
• No history results are stored.
• IPSLA Jitter and Jitter for VoIP initiator and responder is only supported on 5400R with v3 modules (noncompatibility mode), 3810, and 2930F switches.
• The maximum number of Jitter responder sessions (UDP Jitter + Jitter For VoIP) supported is 10. The maximum number of Jitter initiator sessions (UDP Jitter + Jitter For VoIP) supported is 5.
• IMC (Intelligent Management Center) supports below IP SLAs:
NOTE: 5400R requires V3 modules

- UDP Jitter
- UDP Jitter Voip
- UDP Echo
- TCP connect
- ICMP echo
- DHCP

- Measurement of RTT and jitter values is in milliseconds.
- IPv6 SLA for UDP jitter and VoIP is not supported.
- UDP jitter and UDP jitter for VoIP tests are not supported over Tunnel, Trunk, and OOBM interfaces.
- UDP jitter and UDP jitter for VoIP results are not carried forward across failover or a device reboot.
- History bucket size cannot be configured for UDP jitter and VoIP tests. Results are aggregated for the last 25 probes.
- System clocks between the source and the responder must be synchronized with NTP if One Way Delay parameters have to be calculated for UDP Jitter & UDP Jitter for VoIP tests.
- The UDP jitter and UDP jitter for VoIP feature on ArubaOS-Switch has the following limited interoperability with Comware 7 SLA v2 version:
  - One Way packet drops (SD packet loss and DS packet loss) on the Comware Jitter initiator is not reported when interoperating with Aruba Jitter Responder.
- IP SLA responder or initiator implementation is not interoperable with Cisco’s IP SLA feature.

How IP SLA works

1. The source originates a test packet to the destination.
2. The destination responds to the test packet, at times embedding the needed information in the response packet.
3. Upon receiving the response, the source calculates the test results based on the timestamp, other packet parameters, and so on.
4. The source stores the results and updates the history records for the SLA.
5. The source reschedules the SLA for the next run.

NOTE: For one-way delay calculations, the IP SLA sender and IP SLA responder must be NTP Time Synchronized.

Configuration commands

```
[no] ip-sla <ID>
```

Syntax

```
[no] ip-sla <ID>
```
**Description**
Configure the IP Service Level Agreement (SLA) parameters. The value of ID can range from 1-255.

**Options**
- **clear**
  - Clear history records, message statistics, and threshold counters of particular SLA entry.
- **dhcp**
  - Configure DHCP as the IP SLA test mechanism.
- **disable**
  - Disable the IP SLA.
- **dns**
  - Configure DNS as the IP SLA test mechanism.
- **enable**
  - Enable the IP SLA.
- **history-size**
  - Configure the number of history records to be stored for the IP SLA.
- **icmp-echo**
  - Configure ICMP echo as the IP SLA test mechanism.
- **monitor**
  - Configure monitoring parameters and respective threshold-action values.
- **schedule**
  - Configure the start time, stop time, lifetime, and frequency of run for the IP SLA.
- **tcp-connect**
  - Configure TCP connect as the IP SLA test mechanism.
- **tos**
  - Configure the Type of Service value to be set in the test packet for the IP SLA.
- **udp-echo**
  - Configure UDP echo as the IP SLA test mechanism.

On platforms that support Jitter and VOIP, the following options are also provided:

- **udp-jitter**
  - Configure UDP jitter as the IP SLA test mechanism.
- **udp-jitter-voip**
  - Configure UDP jitter for VoIP as the IP SLA test mechanism.

**ip-sla <ID> clear**

**Syntax**

```
ip-sla <ID> clear
```

**Description**
Clear history records, message statistics, and threshold counters of a particular SLA entry.
Options
records
Clear history records, message statistics, and threshold counters of particular SLA entry.

[no] ip-sla <ID> history-size
Syntax
[no] ip-sla <ID> history-size
Description
Configure the number of history records to be stored for the IP SLA. The maximum supported size is 50 and the default value for history-size is 25.

[no] ip-sla <ID> icmp-echo
Syntax
[no] ip-sla <ID> icmp-echo [<IP-ADDR> | <HOST-NAME>] [source <IP-ADDR> | source-interface vlan <VLAN-ID>] [payload-size <SIZE>]
Description
Configure ICMP echo as the IP SLA test mechanism. Requires destination address/hostname and source address/vlan id for the IP SLA of ICMP-Echo SLA type.

payload-size
: Value can range from 1-1440. By default, payload-size is not set.

[no] ip-sla <ID> udp-echo
Syntax
[no] ip-sla <ID> udp-echo [destination [<IP-ADDR> | <HOST-NAME>] <PORT-NUM>] [source <IP-ADDR> | <VLAN-ID>] [payload-size <SIZE>]
Description
Configure UDP echo as the IP SLA test mechanism. Requires destination address/hostname and source address/VLAN ID for the IP SLA of UDP-Echo SLA type.

• PORT-NUM: Value can range from 1024–65535.
• payload-size: Value can range from 1-1440. By default, payload-size is not set.

[no] ip-sla <ID> tcp-connect
Syntax
Description
Configure TCP connect as the IP SLA test mechanism. Requires destination address/hostname and source address/VLAN ID for the IP SLA of TCP connect SLA type. The value of PORT-NUM can range from 1024-65535.
[no] ip-sla <ID> monitor threshold-config

Syntax

Description

Set upper and lower threshold parameters.

- **threshold-type immediate**: Take action immediately when the monitored parameters cross the threshold upper limit (subsequent notifications for upper thresholds are not generated until the parameter values go lower than the configured lower threshold value).
- **threshold-type consecutive**: Take action after threshold is hit consecutively for number of times.
- **action-type**: Describes action to be taken when the upper threshold is crossed.
  - **trap**: Send snmp-trap when configured threshold is hit.
  - **log**: Only log the event when configured threshold is hit.
  - **trap-log**: Send snmp-trap and log the event when configured threshold is hit.
  - **none**: Take no action.

**NOTE**: The command option threshold-config can be individually set for rtt, srcTodstTime, and dstToSrcTime.

[no] ip-sla <ID> monitor packet-loss

Syntax

Description

Configure threshold-action values when packet loss happens.

- **threshold-type immediate**: Take action immediately when the monitored parameters cross the threshold upper limit (subsequent notifications for upper thresholds are not generated until the parameter values go lower than the configured lower threshold value).
- **threshold-type consecutive**: Take action after threshold is hit consecutively for number of times.
- **action-type**: Describes action to be taken when the upper threshold is crossed.
  - **trap**: Send snmp-trap when configured threshold is hit.
  - **log**: Only log the event when configured threshold is hit.
  - **trap-log**: Send snmp-trap and log the event when configured threshold is hit.
  - **none**: Take no action.

[no] ip-sla <ID> monitor test-completion

Syntax

[no] ip-sla <ID> monitor test-completion action-type [trap | log | trap-log | none]
Description
Configure action to be taken when test gets completed.

- **trap**: Send snmp-trap when configured threshold is hit.
- **log**: Only log the event when configured threshold is hit.
- **trap-log**: Send snmp-trap and log the event when configured threshold is hit.
- **none**: Take no action.

**[no] ip-sla <ID> schedule**

Syntax
```
[no] ip-sla <ID> schedule [[now | startTime <START-TIME>] [forever | stopTime <STOP-TIME>]
| repetitions <NUM>] [frequency <FREQUENCY>]
```

Description
Configure the start time, stop time, lifetime, and frequency of run for the IP SLA. The default value for the frequency of operation is 60 seconds.

**[no] ip-sla <ID> tos**

Syntax
```
[no] ip-sla <ID> tos <VALUE>
```

Description
Configure the Type of Service value to be set in the test packet for the IP SLA.

**Valid values**: 0–255

**[no] ip-sla responder**

Syntax
```
[no] ip-sla responder
```

Description
Configure SLA responder to respond to probe packets.

- **IP address**: local interface IP address
- **port**: takes L4 port numbers.
- **SLA types supported**: udp-echo, tcp-connect, UDP Jitter & Jitter For VoIP.

**[no] ip-sla <ID> udp-jitter**

Syntax
```
source [<IP-ADDR> | <VLAN-ID>] [payload-size <SIZE> num-of-packets <NUM> packet-
interval <PKT-INTERVAL>]
```

Description
Configures the UDP Jitter test.
- **Payload-size**: Payload size of the test packet. Value can range from 68-8100. Default value is 68.
- **Num-of-packets**: Number of packets sent in one probe. Default is 10. Allowed range: 10-1000.
- **Packet-interval**: Inter packet gap in milliseconds. Time between consecutive packets within a probe. Default is 20ms. Allowed range: 10-60000

**[no] ip-sla <ID> udp-jitter-voip**

**Syntax**

source [<IP-ADDR> | <VLAN-ID>] [codec-type <CODEC-TYPE> advantage-factor <ADV-FACTOR>]

**Description**

Configures the UDP Jitter for VoIP test.

- **Codec-type**: Codec to be used to encode the test VoIP packets. Available codecs: g711a, g711u, g729a. Default is g711a.
- **Advantage-factor**: Advantage factor to be configured for the test. Default is 0. Allowed range: 0-20.

**Show commands**

**show ip-sla <ID>**

**Syntax**

show ip-sla <ID>

**Description**

Show IP SLA configurations.

**Options**

- **history**
  - Show the IP SLA results history.
- **message-statistics**
  - Show the IP SLA message statistics.
- **results**
  - Show the IP SLA results for UDP Jitter and UDP Jitter VoIP.
- **aggregated-results**
  - Show the IP SLA aggregated results for UDP Jitter and UDP Jitter VOIP.

ICMP ID hash walk:
clear ip-sla responder statistics

Syntax

```
clear ip-sla responder statistics <SLA-TYPE> <LOCAL-IP-ADDR> <LOCAL-PORT-NUM> source <SOURCE-IP-ADDR>
```

Description
Clear IP SLA responder statistics for either UDP jitter or VoIP UDP jitter.

Command context
```
cfg
```

Parameters
```
<SLA-TYPE>
    Specifies the SLA type.
    udp-jitter
        Selects standard UDP jitter.
    udp-jitter-voip
        Selects UDP VOIP jitter.

<LOCAL-IP-ADDR>
    Specifies the local interface IP address

<LOCAL-PORT-NUM>
    Specifies the local interface port number. Range: 1024 to 65535.

<SOURCE-IP-ADDR>
    Specifies the Source IP address.
```

Examples
Clear IP SLA responder statistics for UDP jitter:
```
switch(config)# clear ip-sla responder statistics udp-jitter 1.1.1.1 1100 source 1.1.1.2
```

## Interoperability

**NOTE:** Packet loss is expected when H3C TCP-CONNECT source, with a frequency less than or equal to 10 ms, interoperates with TCP-CONNECT responder.

### IP SLA UDP Jitter and Jitter for VoIP

**Overview**

The UDP Jitter and Jitter for VoIP SLA types enable the user to assess the suitability of the network for voice & video related traffic. These SLA’s basically calculate parameters like RTT, one way delay, one way positive and negative Jitter etc.
The above diagram shows a typical deployment, where voice & video traffic are exchanged between branch offices of an enterprise over the backbone network. Assessment of the network readiness is always helpful for hosting such services. Parameters like RTT, Jitter and one way delay are a good indicator of network health which assist a network administrator to diagnose latency related issues in the network. VoIP traffic is generally sensitive to delays in the network.

Jitter stands for inter-packet delay variance. If the inter-packet delay increases between successive probe packets, jitter is said to be positive. If the inter-packet delay decreases, jitter is said to be negative. Positive jitter values are undesirable for a network as they indicate increased latencies. A value of 0 jitter is desirable.

**Significance of jitter**

Consider a media player which plays video streams from a server. Assume that packets take 1 second in flight to reach the media player. This means the moment a user requests a video from the server, the very first packet will arrive after one second and successive packets will be sent immediately (ideally). In real world scenarios, intermediate node latencies, different return paths for different packets and network congestion can contribute to varying delays. To counter such effects, packets are buffered at the media player. The amount of packet buffering needed can be derived from the jitter values.

**NOTE:** The above analogy is applicable for other voice & video services and can be a good measure to assess the possibility for hosting a service on a network.

**Solution components**

**IP SLA responder**

This device receives IP SLA probe packets from a configured initiator, timestamps the frame at a pre-defined location in the packet upon receipt and sends the same frame back to the initiator.

**IP SLA initiator**

This device initiates IP SLA probe packets to multiple destinations each with a certain user configurable packet content and periodicity.

The initiator timestamps the frame at a pre-defined location before sending the frame out to the configured destinations and re-timestamps the frame at a different location once it receives the same back from the responder.
**IP SLA measurement engine**

This is an application running on the initiator. It processes response frames received from the IP SLA responder and computes one-way delay, jitter and RTT based on the timestamps present in the packet.

This application aggregates this computed information across multiple probe samples and stores this for consumption by an NMS via SNMP or via the device CLI.

It also supports asynchronous user configurable threshold breach notification to an NMS (via SNMP Traps).

---

**SLA Measurements**

The following metrics are measured as part of this IP SLA jitter functionality.

**One way jitter**

One way jitter is defined as the time difference between inter-packets transmit time and inter-packets arrival time in a given direction. This is measured in both the Initiator to Responder direction (referred to as SD jitter) as well as the Responder to initiator direction (referred to as DS jitter).

Ideally, the jitter in both directions should be 0. A positive value of jitter is bad for VOIP and higher values of jitter will mean poor conversation quality. This is explained in the illustration below:
One way delay

One way delay is defined as the time difference between the Initiator transmitting the frame and the Responder receiving the frame. This requires the Initiator and the Responder to be time synchronized with the same clock server. This is explained in the illustration below:

Round trip time

RTT is measured at the initiator on a per packet basis and is as illustrated below:
Overview

The tunneled node feature encapsulates incoming packets from end-hosts in Generic Routing Encapsulation (GRE) and forwards them to a Mobility Controller for additional processing. The Mobility Controller strips the GRE header and processes the packet for authentication and stateful firewall, which enables centralized security policy, authentication, and access control.

The tunneled node feature is enabled on a per-port basis. Any traffic coming from nontunneled node interfaces is forwarded without being tunneled to a Mobility Controller.

Operating notes

- Tunneled node profile may be created using CLI and SNMP.
- The tunneled node profile supports configuring of:
  - Primary controller (IPv4 only).
  - Backup controller (IPv4 only).
  - Heartbeat keepalive timeout – range 1-8 seconds.
- Only one tunneled node profile may be created.
- The tunneled-node profile may be applied to a physical port only via CLI and SNMP.
- The configuration related to the tunneled node profile will be stored in the flash and restored after a boot.
- High availability (HA) will be supported for the tunneled-node related configuration.
- A tunnel, associated with a port, is “up” when both conditions are met. A tunnel is “down” when either of the conditions are not met.
  - Either the primary or backup controller is reachable.
  - A boot strap message response is received from the controller.
- Heartbeat between the switch and controller has failed when the controller does not respond after five attempts. All tunnels are brought down with a heartbeat failure.
- A tunnel “up or down” status will be logged for each tunnel node port in the event log.
- The show tech command dumps all user-mode and test-mode command outputs.
- To reach the Aruba controller, the VLAN must have a manual IP configured.
- With the exception of the 802.1x BPDU, the switch consumes all other BPDUs.
- The tunneled-node can fallback to local switching in the event of a tunnel failure.

Protocol Application Programming Interface (PAPI)

The PAPI Enhanced Security configuration provides protection to Aruba devices, AirWave, and ALE against malicious users sending fake messages that results in security challenges.

Starting from ArubaOS-Switch version 16.02, a minor security enhancement has been made to Protocol Application Programming Interface (PAPI) messages. Protocol Application Programming Interface endpoint...
authenticates the sender by performing a check of the incoming messages using MD5 (hash). All PAPI endpoints — APs, Controllers, Mobility Access Switches, Airwave, and ALE — must use the same secret key. The switch software currently uses a fixed key to calculate the MD5 digest and cooperate with the controller for PAPI enhanced security.

**NOTE:**
To use this functionality, the PAPI security profile must be configured on the controller. For more information on the Aruba controller, see the Aruba Networks Controller Configuration Manual.

## Configuration commands

### tunneled-node-server

**Syntax**

**Description**

Configure tunneled node server information.

The no form of the command removes the tunneled node server configuration.

**Options**

- **controller-IP**
  Configure the controller IP address for the tunneled node.

- **backup-controller-IP**
  Configure the backup controller IP address for the tunneled node.

- **keepalive**
  Configure the keepalive timeout for the tunneled node in seconds [1-40]. The default is 8 seconds.

- **enable**
  Enter the manager command context.

- **fallback-local-switching**
  Apply fallback option when communication with the controller fails. When the tunneled node is applied to a port and the tunnel cannot be established with the controller, the fallback-local-switching option allows port traffic to be switched locally. When the option fallback-local-switching is not specified, the port traffic is dropped when the tunnel reestablishment fails.

**Usage**

```plaintext
switch(config)# tunneled-node-server controller-ip 15.255.133.148
switch(config)# tunneled-node-server backup-controller-ip 15.255.133.148
switch(config)# tunneled-node-server keepalive 40
switch(config)# tunneled-node-server fallback-local-switching
```
**interface tunneled-node-server**

Syntax

```
interface <PORT> tunneled-node-server
```

```
no interface <PORT> tunneled-node-server
```

**Description**

Enable tunneled node on a port.

The `no` command disables the tunneled node on the port.

**controller-ip**

From within the `tunneled-node-profile` context:

**Syntax**

```
[no] controller-ip <IP-ADDR>
```

**Description**

Configure the Controller IP address for the tunneled node.

**Usage**

```
[no] controller-ip <IP-ADDR>
```

**controller-ip**

Configure the Controller IP address for the tunneled node.

**keepalive**

From within the `tunneled-node` context:

**Syntax**

```
[no] keepalive <TIMEOUT>
```

**Description**

Configure the keepalive timeout for the tunneled node in seconds.

Keepalive timeout seconds [1-40].

Default: 8 seconds.

**Options**

**keepalive**

Configure the keepalive timeout for the tunneled node in seconds.

**backup-controller-ip**

From within the `tunneled-node-profile` context:

**Syntax**

```
[no] backup-controller-ip <IP-ADDR>
```
Description
Configure the backup controller IP address for the tunneled node.

Options
backup-controller-ip
  Configure the backup controller IP address for the tunneled node.

Usage
[no] backup-controller-ip <IP-ADDR>

fallback-local-switching
From within the interface context:

Syntax
fallback-local-switching

Description
To switch traffic locally upon losing connectivity to the controller, you must configure the fallback option before connectivity fails. When the tunneled node is applied to a port and the tunnel cannot be established with the controller, the fallback-local-switching option allows port traffic to be switched locally. When the option fallback-local-switching is not specified, the port traffic is dropped when the tunnel reestablishment fails.

VLAN show commands
VLAN show commands display information about configured VLANs.

show tunneled-node-server

Syntax
show tunneled-node-server [state | statistics]

Description
Display switch operation information.

Options
state
  Display the tunneled node port state.

statistics
  Display the tunneled node statistics.

show tunneled-node-server state

<table>
<thead>
<tr>

clear statistics tunneled-node-server

Syntax
clear statistics tunneled-node-server

Description
Clear statistics from the tunneled node server.

</tbody>
</table>

### Restrictions

- Once a tunneled-node profile is applied to a port, the controller IP (primary and backup) cannot be changed.
- IP address cannot be assigned to VLANs that the tunnel-node port belongs to.
- No support for fragmentation and reassembly for encapsulated frames that result in an MTU violation. Such frames will be dropped. It is recommended that you configure the switch-controller path for Jumbo MTU. No support for PMTU detection for tunnel traffic.
- The packets from nontunneled node ports (in the same VLAN as tunnel-node port) will not be bridged to the tunneled-node ports and conversely.

Features not allowed on a tunneled node port/VLAN with tunneled node ports/globally:
<table>
<thead>
<tr>

**PAPI security**

**Protocol Application Programming Interface (PAPI)**

The PAPI Enhanced Security configuration provides protection to Aruba devices, AirWave, and ALE against malicious users sending fake messages that results in security challenges.

Starting from ArubaOS-Switch version 16.02, a minor security enhancement has been made to Protocol Application Programming Interface (PAPI) messages. Protocol Application Programming Interface endpoint authenticates the sender by performing a check of the incoming messages using MD5 (hash). All PAPI endpoints — APs, Controllers, Mobility Access Switches, AirWave, and ALE — must use the same secret key. The switch software currently uses a fixed key to calculate the MD5 digest and cooperate with the controller for PAPI enhanced security.
PAPI configurable secret key

To support enhanced PAPI security, a command is available to configure a MD5 secret key.

`papi-security`

**Syntax**

```
switch# (config) papi-security
```

**Description**

Configure MD5 key for enhanced PAPI security.

**Parameters**

enhanced-security

The enhanced-security CLI must be enabled in Aruba controller for the connection to be truly secured.

`<KEY-STR>`

Configure MD5 key for enhanced PAPI security using a key-string parameter.

`<KEY-VALUE>`

Configure MD5 key for enhanced papi security using a key-value parameter.

**Restrictions**

- To view the status of the PAPI security, using the `show run` command with the option `include credentials` enabled, the PAPI security key will show in the output as an encrypted form.
- Key length has to be between 10-64.
- By default the enhanced-security is disabled.
- When enhanced-security mode is disabled, any AP can obtain the current shared secret key.
- When enhanced-security mode is enabled, an AP is not updated with the new shared secret key unless the AP knows the previous key and the AP is updated with the new key within one hour of the key creation.
- Key length has to be between 10-64 or the following message will appear:

```
Minimum key-value length allowed is 10 characters and maximum allowed is 64 characters.
```

**Usage**

```
Switch(config)# papi-security key-value <KEY-VALUE>
Switch(config)# [no] papi-security <KEY-VALUE>
```

```
papi-security key-value

Switch(config)# papi-security key-value TestKey12345678
Switch(config)# no papi-security key-value
```
Switch(config)# papi-security key-value Test
Minimum key-value length allowed is 10 characters and maximum allowed is 64 characters.

show run with encrypted key

Per-user tunneled node

Aruba per-user tunneled node (PUTN) is similar to the MAS equivalent per-port tunneled node where all ingress traffic is tunneled through a specified switch port to a controller. Aruba PUTN gives ArubaOS-Switch the ability to
tunnel traffic per client through Generic Routing Encapsulation (GRE) from an interface on a switch (tunneled-node-port) to an Aruba controller (tunneled-node-server).

Once PUTN is enabled, the Aruba controller provides a centralized security policy, authentication, and access-control. The decision to tunnel client traffic is based on the user-role. User-role authorizations are given permission to redirect traffic to an Aruba controller when the PUTN status is UP. A secondary role, provided by the authentication subsystem (DCA), when present in the user-role authorizations, notifies the PUTN and provides a secondary role.

PUTN, combined with CPPM/LMA policies, can be used to indicate per client whether that clients traffic is to be tunneled to a controller or forwarded locally.

For example, when a PC Phone is deployed to a network, the administrator can use PUTN to route the PC traffic through additional security and allow the VoIP traffic to move freely through the wired network.

**NOTE:** The current release has a limitation with respect to jumbo. When jumbo is enabled on the uplink tunneled-node-server VLAN, the multicast traffic destined to the switch tunneled users starts dropping as the controller multicast tunnels are programmed with an MTU limit of 1500.

**Flow**
- Authenticate user.
- Apply user role to authenticated user.
- Redirect user traffic to controller
- Apply secondary user-role to user traffic on controller.

**Limitations**
- 1,024 users with redirect policy per switch (or stack).
- 32 users supported per port.
- Tunneled and nontunneled users are not allowed to belong to same VLAN.
- Tunneled node is not supported on port-channel.

**Tunneled node server prerequisites**
Commands necessary to configure a tunneled node server for a tunneled node ArubaOS-switch:

- switch(config)#tunneled-node-server
- switch(tunneled-node-server)# controller-ip <IP-ADDR>
- **Optional:** switch(tunneled-node-server)# backup-controller-ip <IP-ADDR>
- **Optional:** switch(tunneled-node-server)# keepalive interval <Integer>
- switch(tunneled-node-server)# mode role-based
- switch(tunneled-node-server)# enable

These commands are available in detail in the ArubaOS-Switch Configuration Guide at [http://support.arubanetworks.com/](http://support.arubanetworks.com/).

**NOTE:** Per-port tunneled-node encapsulates incoming packets from end-hosts in GRE packets and forwards them to an Aruba Mobility Controller to be processed further. The Aruba Mobility Controller, upon receiving the GRE packets, strips the GRE header and further processes the packet for additional purposes such as authentication, stateful firewall, and others.
Cluster mode

If the controller is in a cluster mode, see that the Mobility Master Configuration managed controller information in the ArubaOS-Switch User Guide at http://support.arubanetworks.com/

Note

PUTN works for Standalone Controller or with the Aruba 8.x controller cluster.

tunneled-node-server-redirect

Syntax

tunneled-node-server-redirect [secondary-role <ROLE-NAME>]

no tunneled-node-server-redirect [secondary-role <ROLE-NAME>]

Description

This command is used to instruct the switch to redirect traffic for a particular user to the user-based tunnel. The no form of this command configures traffic redirect to the user-based tunnel. Secondary role is the new user role that will be applied to the tunneled traffic by the controller.

Command context

user-role

Parameters

secondary-role <ROLE-NAME>

Specifies the secondary role applied on the user traffic by the controller.

Example

User role configuration example on TN switch. The tunneled-node-server-redirect attribute instructs the switch to redirect all traffic with user-role “testrole” to the controller. The secondary-role “authenticated” specified with the redirect attribute should be configured and present on the controller. The switch sent VLAN (client VLAN) has to be present on the controller.

```
class ipv4 "testclass"
   10 match ip 0.0.0.0 255.255.255.255 0.0.0.0 255.255.255.255
   20 match tcp 0.0.0.0 255.255.255.255 0.0.0.0 255.255.255.255
   exit
policy user "testpolicy"
   10 class ipv4 "testclass" action permit
   exit
aaa authorization user-role name "testrole"
policy "testpolicy"
   vlan-id 100
tunneled-node-server-redirect secondary-role "authenticated"
   exit
```

Show the tunneled-node-server status for all users.

```
switch-PoEP# show tunneled-node-users all

+----------------+-----------------+-----------------+-----------------+-----------------+

604 Aruba 2930F / 2930M Management and Configuration Guide for ArubaOS-Switch 16.07
**show user-role**

**Syntax**

```
show user-role <role-name>
```

**Description**
Displays the user-role information for the specified user-role name.

**Command context**
manager or operator

**Parameters**

```
<role-name>
```
Specifies the user-role name.

**Examples**

Shows the user-role by specific name.

```
switch# show user-role XYZ
```

### User Role Information

<table>
<thead>
<tr>
<th>Name</th>
<th>XYZ</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>local</td>
</tr>
<tr>
<td>Reauthentication Period (seconds)</td>
<td>0</td>

<td>ROLE NAME</td>
</tr>
</tbody>
</table>

**show tunneled-node-server information**

**Syntax**

```
show tunneled-node-server [information | statistics <controller> | state <controller>]
```

**Description**

Shows the tunneled-node-server information, statistics, or state.

---

**NOTE:** Information for SAC and SSAC Switch Anchor Controller (SAC), Standby Anchor Controller (SSAC) and User Anchor Controller (UAC) is available in the ArubaOS-Switch Controller Guide at https://support.arubanetworks.com/.

---

**Command context**
manager or operator

**Parameters**

```
information
```
Specifies tunneled-node-server information, node-list, and the bucket map information.
**statistics <controller>**

Specifies the data plane statistics with respect to a controller for each port.

**state <controller>**

Specifies the data plane state with respect to a controller.

---

**Example**

Show the cluster, node-list, and the bucket map information.

```
Switch# show tunneled-node-server information

SAC Information

SAC : 121.34.211.90
Standby-SAC : 192.168.34.111

<td>23457</td>
</tr>
</tbody>
</table>

show tunneled-node-users

Syntax
show tunneled-node-users [all | count | down | mac <MAC-ADDRESS> | port <PORT-ADDR> | up ]

Description
Shows the status of a client after configuring and enabling tunneled-node-server-redirect.

Command context
manager or operator

Parameters
<ALL>
Specifies all clients and their status.

<COUNT>
Specifies the total number of clients configured to tunnel their traffic to the controller.

<DOWN>
Specifies the clients which are not able to tunnel their traffic.

PORT <PORT-ADDR>
Specifies the port client status.

MAC <MAC-ADDRESS>
Specifies the client status based on the MAC address desired by the user.

<UP>
Specifies the status of clients with tunnels up.

Example
Show tunneled-node-users information for all clients.

switch(user-role)# show tunneled-node-users all

<table>
<thead>
<tr>
<th>PORT</th>
<th>MAC-ADDRESS</th>
<th>TUNNEL-STATUS</th>
<th>SECONDARY-USERROLE</th>
<th>FAILURE-REASON</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>XY2123</td>
<td>UP</td>
<td>ROLE NAME1</td>
<td></td>
</tr>
<tr>
<td>234</td>
<td>XY21234</td>
<td>DOWN</td>
<td>ROLE NAME2</td>
<td>UAC_DOWN</td>
</tr>
</tbody>
</table>

Example
Show the total number of clients configured with the user-based tunneled-node.
switch(user-role)# show tunneled-node-users count

Total number of clients configured with user-based tunneled node: <NUMBER>

**Example**

Show the port access client status in detail.

switch(user-role)# show tunneled-node-users port 1/7

<table>
<thead>
<tr>
<th>PORT</th>
<th>MAC-ADDRESS</th>
<th>TUNNEL-STATUS</th>
<th>SECONDARY-USERROLE</th>
<th>FAILURE-REASON</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/7</td>
<td>d48564-940c46</td>
<td>UP</td>
<td>authenticated</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

Show the port access clients in detail.

switch# show port-access clients

Downloaded user roles are preceded by *

ip source-interface tunneled-node-server

Syntax

switch(config)# ip source-interface tunneled-node-server
[<IP_ADDRESS> | loopback <LOOPBACK_INTERFACE> | vlan <VLAN_ID>]

Description

Defines source IP address or interface for specified protocol.

NOTE:

- If interface has multiple addresses, lowest address is used.
- Protocols not configured with a specific address will use the IP address of outbound interface as source.

Command context

ip source-interface

Parameters

<IP_ADDRESS>

Specifies IP address.

<LOOPBACK_INTERFACE>

Specifies a loopback interface.

<VLAN_ID>

Specifies VLAN ID.

Example

Running configuration:

NOTE: Requires (config)#show run context:

; J9850A Configuration Editor; Created on release #KB.16.05.0000x
; Ver #12:08.1f.fb.7f.bf.bb.7c.59.fc.7b.ff.fc.ff.ff.ff.3f.ef:f4
hostname "Anay5400R"
module A type j9989a
module B type j9986a
module C type j9989a
module D type j9986a
Using Downloadable User Roles with PUTN

This feature extends download ability of user roles to controller. Supported platforms: 3810, 5400R, 2930F and 2930M.

- There are two roles required when using Downloadable User Roles with PUTN:
  
  **Primary user role:** Configured on switch
  
  **Secondary user role:** Configured on controller

- Aruba network switches support Downloadable User Roles for primary roles present in the switch. Secondary roles present in the controller are manually configured on the controller.

**NOTE:** This feature is only available for:

- CPPM Version 6.7.0 onward
- Aruba Controller Version 8.3.0 onward

- To support Downloadable User Roles on controller, a new VSA (HP-CPPM-Secondary-Role) is introduced in CPPM 6.7.0, which contains the secondary user role name:

**CPPM Sample Configuration**

aaa authorization user-role name "<role-name>"

vlan-id <vlan id> tunneled-node-server-redirect VSA
Preventing double tunneling of Aruba Access Points

When an Aruba Access Point (AP) is connected to a port on which per-port tunneled node is configured, there are two tunnels from that port to the Controller - one for the AP and another for the tunneled node. To improve performance of APs connected to tunneled node ports, the following configuration parameter under the device profile feature prevents double tunneling.

The parameter decides whether to allow or not, a tunneled node to be configured on the port on which the device-profile is applied. Use the command `switch(config)# device-profile name <device-profile-name> [no] allow-tunneled-node`.

**NOTE:** The default setting of `device-profile` allows tunneled node. Device profile is applied on the port only by reading Organizational Specific TLV in LLDP packets.

Preventing double tunneling using device profile parameter

device-profile name

**Syntax**

`device-profile name <device-profile-name> [no] allow-tunneled-node`

**Description**

Allows or disallows tunneled node when device profile is applied on that port.

**Command context**

`config`
Parameter
<device-profile-name>

Specifies the name of the device profile to be configured.

Usage

To create a device-profile named “test”, execute the following command:

```
switch(config)# device-profile name test
```

To allow tunneled-node by the configured device profile parameter, execute the following command:

```
switch(device-profile)# allow-tunneled-node
```

Examples

```
switch(config)# device-profile name <device-profile-name>
switch(device-profile)#
allow-jumbo-frames Configure jumbo frame support for the device port.
allow-tunneled-node Configure Tunneled Node support for the device port.
cos Configure the Class of Service (CoS) priority for traffic from the device.
egress-bandwidth Configure egress maximum bandwidth for the device port.
ingress-bandwidth Configure ingress maximum bandwidth for the device port.
poe-max-power Configure the maximum PoE power for the device port.
poe-priority Configure the PoE priority for the device port.
speed-duplex Configure the speed and duplex for the device port.
tagged-vlan Configure this port as a tagged member of the specified VLANs.
untagged-vlan Configure this port as an untagged member of specified VLAN.
```

Execute `show run` command to display the tunneled mode configuration in an enabled or disabled state:

```
switch(config)# show run
; J9625A Configuration Editor; Created on release #KB.16.05.0000x
; Ver #0f:02.43.18.82.34.61.1c.28.f3.84.9c.63.ff.37.2f:da
hostname "switch"
snmp-server community "public" unrestricted
device-identity name "cpe" lldp oui 33bbcc
device-identity name "cpe" lldp sub-type 1
device-identity name "phone" lldp oui 112233
vlan 1
    name "DEFAULT_VLAN"
    untagged 1-28
    ip address dhcp-bootp
    exit
device-profile name "ram"
    exit
device-profile name "test"
    exit
device-profile type "scs-wan-cpe"
    associate "ram"
    enable
    exit
device-profile type-device "cpe"
    associate "ram"
    enable
    exit
device-profile type-device "phone"
```

Chapter 18 Tunneled node 613
When allow-tunneled-node is disabled:

```
switch(config)# show run
; J9625A Configuration Editor; Created on release #KB.16.05.0000x
; Ver #0f:02.43.18.82.34.61.1c.28.f3.84.9c.63.ff.37.2f:da
hostname "switch"
snmp-server community "public" unrestricted
device-identity name "cpe" lldp oui 33bbcc
device-identity name "cpe" lldp sub-type 1
device-identity name "phone" lldp oui 112233

vlan 1
  name "DEFAULT_VLAN"
  untagged 1-28
  ip address dhcp-bootp
exit
device-profile name "ram"
exit
device-profile name "test"
  no allow-tunneled-node
exit
device-profile type "scs-wan-cpe"
  associate "ram"
  enable
exit
device-profile type-device "cpe"
  associate "ram"
  enable
exit
device-profile type-device "phone"
  associate "default-device-profile"
exit
```

**show device-profile config**

**Syntax**

show device-profile config

**Description**

Displays device profile configuration.

**Command context**

config

**Usage**

To verify whether tunneled-node is allowed (when "test" is device-profile name):

```
switch(device-profile)# show device-profile config test
```

To verify the output when tunneled-node is disabled:

```
switch(device-profile)# no allow-tunneled-node
switch(device-profile)# show device-profile config test
```
Example

switch(config)# show device-profile config
Device Profile Configuration

Configuration for device-profile : default-ap-profile
untagged-vlan : 1
tagged-vlan : None
ingress-bandwidth : 100%
egress-bandwidth : 100%
cos : 0

allow-jumbo-frames : Disabled
allow-tunneled-node: Disabled

Device Profile Configuration

Configuration for device-profile : test
untagged-vlan : 1
tagged-vlan : None
ingress-bandwidth : 100%
egress-bandwidth : 100%
cos : None
speed-duplex : auto
poe-max-power : Class/LLDP
poe-priority : critical
allow-jumbo-frames : Disabled
allow-tunneled-node: Disabled

Chapter 18 Tunneled node
The Time Domain Reflectometry (TDR) or Cable Diagnostics is a port feature supported on some switches running ArubaOS-Switch software. TDR is used to detect cable faults on 100BASE-TX and 1000BASE-T ports.

**Virtual cable testing**

The Virtual Cable Test (VCT) uses the same command as TDR. It is applicable only for GigT transceivers like copper transceiver (J8177C–ProCurve Gigabit 1000Base-T Mini-GBIC). The VCT test results include distance to the fault, but not the cable length.

**Cable Diagnostics**

**Syntax**

```plaintext
test cable-diagnostics <PORT-LIST>
```

**Description**

Use the command to test for cable faults.

**Option**

`PORT-LIST`

Specify copper port as a input port number.

---

**Test cable-diagnostics C21**

```plaintext
test cable-diagnostics C21
```

The ‘test cable-diagnostics’ command will cause a loss of link and will take a few seconds per interface to complete.

```
Continue [Y/N]? y
```

<table>
<thead>
<tr>
<th>MDI Port Pair</th>
<th>Cable Status</th>
<th>Distance to Fault</th>
<th>Pair Skew</th>
<th>Pair Polarity</th>
<th>Mode</th>

<td>0 ns</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7-8</td>
<td>Open</td>
<td>1 m</td>
<td>0 ns</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Test cable-diagnostics 1/1-1/10**

```plaintext
switch# test cable-diagnostics 1/1-1/10
```

This command will cause a loss of link on all tested ports and will take several seconds per port to complete. Use the ‘show cable-diagnostics’ command to view the results.

```
Continue (y/n)? Y
```

```plaintext
switch# show cable-diagnostics 1/1-1/10
```

show cable-diagnostics

Syntax

show cable-diagnostics <PORT-LIST>

Description

Use the command to generate results of completed tests on single or multiple ports. For incomplete tests, a warning is displayed.

Option

PORT

Specify one copper port as an input port number.

clear cable-diagnostics

Syntax

clear cable-diagnostics

Description

Use the command to clear the result buffer.

Example

switch(config)# clear cable-diagnostics

Limitations

TDR has the following limitations:

• TDR length accuracy is ± 5 m

• Does not work on Smart Rate Interfaces with 10GBASE-T and NGBASE-T (2.5G, 5G copper) ports available on:
  ◦ v3 blades
    – J9991A — Aruba 20-port 10/100/1000BASE-T PoE+ / 4-port 1/2.5/5/10GBASE-T PoE+ MACsec v3 zl2 Module
    – J9995A — Aruba 8-port 1/2.5/5/10GBASE-T PoE+ MACsec v3 zl2 Module
  ◦ 3810M (JL076A — Aruba 3810M 40G 8 HPE Smart Rate PoE+ 1-slot Switch)
• Not supported on v2 zl modules
• Valid only on 100BASE-TX and 1000BASE-T ports
Overview

The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol in the Internet Protocol Suite used by Aruba network devices for advertising their identity, capabilities, and neighbors on an IEEE 802 local area network, principally wired Ethernet. The LLDP-bypass authentication feature provides zero touch provisioning of Aruba 802.11ac wireless access points (APs).

In an LLDP module, the packet is parsed and inspected for the presence of an Aruba Organizational Unit Identifier (OUI) Type-length-value (TLV). The Aruba OUI TLV, once detected, will bypass the authentication and permit traffic to pass on the port. If the Aruba OUI TLV is absent, the packet will be dropped and processing of the packet or LLDP transmission for that device will not pass.

In ZTP environments, when an Aruba AP is plugged into the switch port, the device profiles will be applied on the AP without any user intervention. After discovery of an Aruba AP, the switch will dynamically provision the AP connected port without initiating any authentication needs. This feature is enabled at the port-level or on a range of ports.

Feature interaction

- LLDP-bypass authentication feature supports port mode only.
- Devices having the LLDP packets with customized OUI/Aruba AP/Aruba OS switch/swiscom devices are bypassed from authentication.
- If LLDP-bypass is configured alone, all the connected clients are allowed without any authentication.
- If LLDP-bypass is configured with authentication features such as 802.1X, LMA or MAC auth and with or without client limit, authentication is not triggered for any client.
- If LLDP-bypass is configured with 802.1X, and LMA, authentication will not be triggered for any client.
- If LLDP-bypass is configured with 802.1X, and MAC, authentication will not be triggered for any client.
- If there is a contention between device profile parameters and RADIUS parameters, RADIUS will override.

Configuration commands

aaa port-access lldp-bypass

From within the configure context:

Syntax

[no] aaa port-access lldp-bypass

Description

The command configures lldp-bypass authentication on the switch ports.

Configure lldp-bypass on the switch ports to bypass authentication for Aruba-APs which sends special LLDP TLVs. When LLDP-BYPASS is enabled on a port, it will behave as all other devices and bypass LLDP PDU for all device-profile enabled device.

By default, lldp-bypass is disabled on the switch ports.
Usage
[no] aaa port-access lldp-bypass <PORT-LIST>

Description

</tr>
<tr>
<td>When learn-mode is configured on the port:</td>
<td>If lldp-bypass is enabled on the port: A1: Cannot apply learn-mode on the port A1 when lldp-bypass is enabled on that port.</td>
</tr>
</tbody>
</table>

Table Continued
Validation | Error/Warning/Prompt
--- | ---
When trunk, distributed trunk or mesh is configured on the port: | If lldp-bypass is enabled on the port:
Cannot apply mesh or manual trunks on the port A1 when lldp-bypass is enabled on that port.

When MAC-lockdown is enabled on the port: | If lldp-bypass is enabled on the port:
Cannot apply MAC lock-enable on the port A1 when lldp-bypass is enabled on that port.

Security Warning when enabling lldp-bypass on the port.
Enabling lldp-bypass on the port may give access to any Aruba-AP that sends a special LLDP TLV without undergoing any authentication. This configuration may allow network access to the rogue devices that are capable of sending the special LLDP TLV.

Overview of VSF

Aruba Virtual Switching Framework (VSF) technology virtualizes up to eight physical devices in the same layer into one virtual fabric which provides high availability and scalability. A virtual fabric is therefore multiple physical devices in the same layer that use VSF technology.
VSF allows supported switches connected to each other through normal Ethernet connections (copper or fiber) to behave like a single switch.

**Figure 102:** Two devices using VSF technology appearing as a single node to the upper-layer and lower-layer devices

For 16.01, VSF supported a 2–member stack for a pair of 5400R switches with V3 blades, interconnected through standard Ethernet connections with front-plane stacking capability. Interswitch connectivity was restricted to 10G and 40G links. From 16.03 onwards, VSF supported a 4-member stack for 1G and 10G links. In VSF 8–member stack, the same front-plane stacking capability has been extended to 2930F switches. Variants have:

- 1G (copper and SFP) ports and 10G (SFP+) ports.
- PoE+ and non-PoE+ ports.
- None of the variants have an OOBM port.

The VSF feature allows the user to form a stack of up to eight devices of any SKU, including mixing the SKUs in a single stack. The switches in these stacks are interconnected using standard Ethernet connections. These interconnections between member switches are called VSF links. Each VSF link can comprise up to eight individual VSF ports, and traffic between two members will be load-balanced automatically across all the...
connected ports. Each switch can have two VSF links. The switches behave as a single virtual switch. 2930F supports a maximum of four 10G ports.

**Figure 103: A 4–member VSF stack**

![Figure 103: A 4–member VSF stack]

**NOTE:** The preceding figure applies to a VSF stack having more than four members too.

## Benefits of VSF

### Simplified topology and easy management

A VSF fabric appears and behaves as one logical switch and is accessible by the network through a single IP address.

**NOTE:** Spanning tree features are not necessary among VSF members.

### 1:1 redundancy

One member acts as the commander to manage and control the entire VSF fabric. One of the switches acts as a standby and backs up the commander, and takes over in case of commander failure.

### VSF port aggregation

A VSF link can aggregate up to eight VSF ports with the immediate neighboring member. This provides redundancy till failure of seven VSF ports.

### Distributed trunking

The Ethernet link aggregation feature can be used to aggregate physical links between the VSF and its upstream or downstream devices across the VSF members. This eliminates the need for spanning tree and also provides load balancing across all ports of the link aggregate.

### Network scalability

The processing power is equal to the Commander, the forwarding capacity is equal to all the stack members combined.
**VSF domain ID**

VSF uses VSF domain IDs to uniquely identify VSF fabrics and prevent VSF fabrics from interfering with one another. One VSF fabric forms one VSF domain.

*Figure 104: Two VSF domains*

**VSF link**

A VSF link is a logical interface that connects VSF member devices. Every VSF-capable device supports a VSF link.

_I-Link<Member ID>_1 is the default VSF link name._

To configure a VSF link, a minimum of one physical interface should be bound to the link. The bound physical interfaces are automatically aggregated to form a VSF link. A VSF link goes down only if all its VSF physical interfaces are down.

**Physical VSF ports**

VSF ports connect VSF member devices and must be bound to using a VSF link. These VSF ports forward VSF protocol packets and data traffic. Up to eight ports can be bound to a VSF link.

NOTE: Once a port is bound to a VSF link, all existing configuration associated with the port, such as VLAN membership and speed, will be removed.

**VSF member ID**

VSF fabric uses member IDs to uniquely identify and manage its members. The first part of the interface module number is the Member ID information, which identifies interfaces in a VSF fabric. The device that wins the election
and becomes a Commander, will retain its member ID, while the other will automatically be assigned a different unassigned member ID from the pool and reboot.

NOTE: If the VSF member ID changes when joining a VSF virtual chassis, it will cause a reboot of that member and not the whole VSF virtual chassis.

Interface naming conventions

An interface is named in the following format:

Interface name

<member ID>/<port-index> For example: 1/1, 2/24.

Definition

<member ID>

VSF member ID of the switch. The VSF member ID will be a part of the interface name in a VSF fabric, whether a device has formed a VSF fabric with other devices, or not. A single device is also considered to be a standalone VSF fabric.

<port-index>

Index of the port on the device. Port index depends on the number of ports available on the linecard (or Interface Module).

For example, on VSF, an interface name would take this form:

<member ID>/<interface-module><port-index>

2/4

where 2 is the member ID and 4 is the port-index.

VSF member roles

- **Commander**: Control and management plane protocols run on the Commander, which is responsible for managing the forwarding databases, synchronizing them with the Standby and controlling all line cards including that of the Standby.

- **Standby**: Standby is a stateful backup device for the Commander and is ready to take control of the VSF virtual chassis if the Commander device fails. This enables the VSF virtual chassis to continue its operations seamlessly in the event of a failure.

- **Member**: All devices in the stack other than the commander and standby are called member switches. The member switch does not run any networking protocols and has no states. The ports on this switch are directly controlled and programmed by the commander switch. When a standby takes over as commander, one of the member switches is upgraded to standby role.

NOTE: All switches in the VSF stack will have the same software version. During stack formation, switches which do not have the same software version as the commander, will be updated to the commander's software. This will cause a reboot of the updated switch.

Member priority

Member priority determines the possibility of a member device being elected as the Commander. A member with higher priority is more likely to be elected as the Commander. The default priority is 128, but can be between 1 and 255.
NOTE: Changing the priority does not affect the commander immediately. It will take effect from the next stack reboot, during the commander election.

**Supported topologies**

- A VSF fabric can have up to eight members.
- A VSF member can have up to two VSF links.
- A VSF fabric with ring topology is recommended. Loss or failure of one link in this topology will degrade the topology to chain, without losing any VSF members from the stack. Traffic will still continue with minimal loss of in-flight traffic.

Running-configuration synchronization

VSF uses a strict running-configuration synchronization mechanism. In a VSF fabric, the Commander manages and retains the configuration of all the devices. All other devices obtain and use the running configuration from the Commander.

VSF split

A VSF split can occur due to a VSF link failure where all ports in the VSF link go down or any member is power-cycled or crashes in the chain topology. This failure results in independent VSF fabric fragment each having its own Commander role. It is recommended to configure a Multiple Active Detection (MAD) mechanism to avoid duplicate IP addresses, routing issues and traffic forwarding problems when a VSF split occurs.

Figure 105: VSF split

In the preceding figure, after the split, Member 1 will be elected as the new Standby in the previous Commander fragment. Previous Standby will failover and become Commander. Member 2 will be elected as a new standby to that fragment. Once the fragment become inactive, all front plane ports except VSF links will be brought down. A limited set of CLI commands will be available on the inactive fragment.

VSF merge
VSF merge occurs on connecting two different VSF fragments having the same domain-ID through VSF links. One of the VSF fragments reboots to merge with the other fragment and forms one VSF fabric. Devices merge only if they have the same domain ID.

**Figure 106: VSF Merge**

![VSF Merge Diagram]

**NOTE:** Only two fragments can be merged at a time.

### VSF commands

**Configuration commands**

**vsf enable**

**Syntax**

```bash
vsf enable domain <DOMAIN-ID>
```

**Description**

Enable VSF on the switch. Allows for switches to be stacked using Ethernet ports.

**Parameters**

- `<DOMAIN-ID>`
  
  The domain ID can be from 1 to 4294967295.

**NOTE:** The command `vsf enable` causes the switch to reboot once and form the fabric. Upon reboot, the switch comes up in the "VSF enabled" mode. Port numbers are prefixed with member numbers, such as "1/1". The configuration on the switch becoming Commander will be retained, but any pre-existing configuration on other switches will be over-written. The switch will inherit the same switch software as the member becoming Commander. If the software image of a switch needs to be updated, the switch will reboot twice.

**vsf disable**

**Syntax**

```bash
vsf disable
```

**Description**

Disable VSF on the virtual chassis.

**Restriction**

This command will not be available until VSF is enabled.
vsf member link

Syntax

[no] vsf member <MEMBER-ID> link <LINK-ID> [[ethernet] <PORT-LIST> | name <LINK-NAME> [start-disabled]]

Description

Create the VSF links. A set of physical ports between any two members, carrying VSF traffic, is collectively referred to as a VSF link.

Parameters

<MEMBER-ID>

The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

LINK-ID

VSF link ID value 1 to 2.

PORT-LIST

The port number or a list of ports. Up to eight ports can be assigned into a VSF link.

LINK-NAME

The VSF link name. Up to 11 characters are allowed for link name.

Operating Notes

• A VSF link is a logical port dedicated to the internal connection of a VSF virtual device.
• A VSF link is effective only after it is bound to a physical port.
• When an Ethernet port is bound to a VSF link, it carries VSF data traffic and VSF protocol packets.

vsf domain

Syntax

vsf domain <DOMAIN-ID>

Description

Change a domain ID for the VSF virtual chassis.

Once VSF is enabled and virtual chassis is formed, VSF domain ID can be changed using this command.

Parameters

<DOMAIN-ID>

The VSF virtual chassis domain ID. Domain ID value can be in the range of 1 to 4294967295.

vsf member

Syntax

vsf member <MEMBER-ID>

Description

Configure VSF member parameters.

Parameters
The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

**vsf member shutdown**

For a switch that physically exists, this command will cause the switch to shut down. `shutdown` is used in preparation to remove the switch from the virtual chassis. The switch will not become a voting member of the virtual chassis again until it is rejoined.

The `shutdown` command cannot be used on the Commander. The `shutdown` command will succeed only if the switch physically exists and is an active member of the virtual chassis.

**Syntax**

```
vsf member <MEMBER-ID> shutdown
```

**Description**

Shut down the VSF virtual chassis member.

**Parameters**

*<MEMBER-ID>*

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

**Restriction**

Shutdown will not be available until VSF is enabled.

**vsf member reboot**

**Syntax**

```
boot vsf member <MEMBER-ID>
```

**Description**

Reboot the VSF member and have it rejoin the virtual chassis with the current configuration. If the `boot` option is specified, the switch will come back up with the existing member-ID and rejoin the virtual chassis with the current configuration.

**Parameters**

*<MEMBER-ID>*

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

**Restriction**

Reboot will not be available until VSF is enabled.

**vsf member remove**

This command removes the entire configuration for a specified member. After issuing the command, the specified member-ID is available for reuse and may be provisioned or assigned to another device.

If the member physically exists, its configuration will be erased. It will then be powered down by default.

**Syntax**

```
vsf member <MEMBER-ID> remove
```

**Description**

Erase the VSF virtual chassis member configuration.

**Parameters**
<MEMBER-ID>

The VSF member-ID for the member command/ or parameter. Member ID value can be in the range of 1 to 8.

Restriction

Remove will not be available until VSF is enabled.

vsf member remove reboot

description

Removes the entire configuration for a specified member and reboots it. If the member physically exists, its
configuration will be erased. If the VSF link is still present, the member reboots and joins the stack through
automatic configuration.

Command context

config

Parameters

<MEMBER-ID>

The VSF member-ID for the member command/ or parameter. Member ID value can be in the range of 1 to 8.

Example

switch# config
switch(config)# vsf member 2 remove reboot

vsf member priority

description

Assign a priority to the specified VSF virtual chassis member. The higher the priority, the more likely that the
virtual chassis member will become the commander at the next virtual chassis reboot. The default priority value is
128.

Parameters

<MEMBER-ID>

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

<PRIORITY>

The priority value for VSF member. Priority value can be in the range of 1 to 255.

vsf member type

description

This CLI command provisions a switch with the member ID and the type defined by the specified J-number for the
device. After provisioning the member, the user may perform any configuration on the device ports.

A “strict” provisioning specifies a MAC address and allows for only one device with the matching J-number and
MAC to be configured.
A "loose" provisioning allows the device with the specified J-number to be configured without a MAC address being specified. This allows any device which matches the J-number to adopt this configuration.

If a provisioned configuration exists with the member ID, the following command is used to change the provisioning from “strict” and “loose” and vice versa. It is recommended to configure the member VSF links, in case of “strict” and “loose” provisioning. A warning is also displayed while configuring.

```
switch(config)# vsf member 8 type jl264a mac-address e0071b-c6d180
This will save the current configuration. Continue (y/n)?  y
Warning - The link and port should be provisioned for member 8 to join the VSF stack.
```

```
switch(config)# vsf member 8 type jl264a
This will save the current configuration. Continue (y/n)?  y
Warning - The link and port should be provisioned for member 8 to join the VSF stack.
```

```
switch(config)#
```

**Syntax**

```
vsf member <MEMBER-ID> type <TYPE> [mac <MAC-ADDR>]
```

**Description**

Configure the family of the VSF member-switch being provisioned. After provisioning, the VSF member-switch can be configured as if it were physically present. When a VSF member-switch matching the provisioned details joins the VSF, it is provided this configuration. A new or missing VSF member can be configured as a provisioned device by using this command.

**Parameters**

* <**MEMBER-ID**>*

   The VSF member-ID for the member command/parameter. Member ID value can be in the range of 1 to 8.

* <**TYPE**>*

   Configure the family of the VSF member-switch being provisioned.

* <**MAC-ADDR**>*

   Configure the MAC address of the VSF member switch being provisioned.

**Restrictions**

- If switch "N" physically exists, the command will fail.
- If switch "N" is provisioned, the command can be used to change the MAC or type.
- If the J-Number is known to not support stacking, or the J-Number is unknown, the command will fail.
- If the same MAC address is already provisioned or exists on another member ID, the command will fail.

**Usage**

```
vsf member <2> type <J9850A> mac <001122-334455>
Updates the strict provisioning for VSF VC member 2, and changes the MAC address to 001122-334455.
```

```
vsf member <2> type <J9850A>
```

---

Chapter 21 Virtual Switching Framework (VSF) 639
Changes the “strict” provisioning for VSF VC member 2 to “loose” provisioning. The configured MAC address is then removed.

```
vsf member <2> type <J9850A> mac <00aabb-cceedd>
```

Changes “loose” provisioning for VSF VC member 2 to “strict” provisioning with MAC address 00aabb-cceedd.

```
snmp-server enable traps vsf
```

**Syntax**

```
[no] snmp-server enable traps vsf
```

**Description**

Enable traps for the VSF functionality.

```
vsf port-speed
```

**Syntax**

```
vsf port speed <SPEED>
```

**Description**

Configure the port speed for all VSF ports. Ports that do not support the configured speed can be part of the VSF, but will not be operational. By default, the speed for the VSF is automatically set to the maximum speed of the first link port added. The port speed cannot be set to default if there are ports in the link. Changing the link speed of the VSF ports will trigger a reboot if the entire stack.

**Parameters**

```
<SPEED>
```

The allowed values for port speeds are 1g and 10g.

**Usage**

```
[no] vsf port speed <SPEED>
```

The no form of the command cannot be executed if there are ports configured on the link. All the ports in the link have to be unconfigured before setting the speed to default.

```
Example input
```

```
Switch(config)# vsf port-speed
1g Specify the VSF ports to auto-negotiate at 1 Gbps.
10g Specify the VSF ports to auto-negotiate at 10 Gbps.
```

```
vsf vlan-mad
```

**Syntax**

```
vsf vlan-mad <VLAN-ID>
```

**Description**

Configure the VSF Multi-Active Detection (MAD) VLAN. The MAD VLAN is used for stack fragment discovery when there is a stack split. Only one MAD VLAN can be configured.

**Parameters**

```
<VLAN-ID>
```

VLAN identifier or the VLAN name if configured. Vlan ID value can be in the range of 1 to 4096.

**Usage**
[no] vsf vlan-mad <VLAN-ID>

**vsf lldp-mad ipv4**

**Syntax**

[no] vsf lldp-mad ipv4 <IPV4_ADDR> v2c <COMMUNITY-STR>

**Description**

Enable LLDP-MAD on the VSF device.

---

**NOTE:** The command `vsf lldp mad` requires a peer switch to be configured as the "assist" device. LLDP-MAD is applicable only for a two-member VSF stack.

**Parameters**

**<IPV4_ADDR>**

The IPv4 address of the MAD (Multi-Active Detection) device.

**<COMMUNITY-STR>**

The SNMP community string for the MAD (Multi-Active Detection) device.

**Usage**

Switch(config)# vsf lldp-mad ipv4

Switch(config)# vsf lldp-mad ipv4 <IPV4_ADDR>

Switch(config)# vsf lldp-mad ipv4 <MAD-IP-ADDRESS> v2c

Switch(config)# vsf lldp-mad ipv4 210.10.0.12 v2c <COMMUNITY-STR>

**Show commands**

**show vsf**

**Syntax**

show vsf

**Description**

Shows the list of VSF virtual chassis members that are provisioned.

**Restrictions**

`show vsf` can be run only after VSF is enabled.

**Example output**

```
switch# show vsf

VSF Domain ID : 123
MAC Address : 941882-435589
VSF Topology : Ring
VSF Status : Active
Uptime : 26d 20h 36m
VSF MAD : None
VSF Port Speed : 10G
Software Version : WC.16.06.0000x

ID  MAC Address       Model                                 Pri Status
--- ----------------- ------------------------------------- --- ---------------
```

---

Chapter 21 Virtual Switching Framework (VSF)
The preceding example shows:

- Topology is ring.
- Member 7 is Commander
- Member 3 is Standby
- Member 1, 2, 4, 5, 6, and 8 are Members

**show vsf detail**

**Syntax**

`show vsf detail`

**Description**

This commands shows detailed information related to the current state of the VSF virtual chassis.

**Example output**

```
switch# show vsf detail

VSF Domain ID : 500
MAC Address : ecebb8-d0c905

Chapter 21 Virtual Switching Framework (VSF)
The above example shows:
show vsf link

Syntax
show vsf link

Description
Shows the VSF port state of the VSF links for each VSF member.

Example output

switch# show vsf link

VSF Member 1

<table>
<thead>
<tr>
<th>Link</th>
<th>Link-Name</th>
<th>State</th>
<th>Member</th>
<th>Link</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td>6</td>
<td>2</td>
</tr>
</tbody>
</table>

**NOTE:**

A VSF port speed which does not match with the global port speed, will be in a down state. The command `show vsf link detail` will display an error message.

### show vsf link detail

**Syntax**

`show vsf link detail`

**Description**

Displays a detailed output of VSF port state and links for each VSF member.

**Example output**

```
switch# show vsf link detail
VSF Member: 1     Link: 1
Port     State
-------- ------------
1/9      Up: Connected to port 2/49
```
<table>

</table>
show vsf member

Syntax

show vsf member <MEMBER ID>

Parameters

<MEMBER ID>

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

Example output

switch# show vsf member 1
Member ID : 1
MAC Address : f40343-f83680
Type : JL256A
Model : Aruba JL256A 2930F-48G-PoE+-4SFP+ Switch

show vsf topology

Syntax

show vsf topology
**Description**

This command shows information about VSF virtual chassis member connections.

**Example output**

```
switch# show vsf topology
VSF member's interconnection with links:
+----+    +----+    +----+    +----+    +----+    +----+    +----+
| 1 |1==1| 2 |2==1| 3 |2==1| 4 |2==1| 5 |2==1| 6 |2==1| 8 |1==2| 7 |
+----+    +----+    +----+    +----+    +----+    +----+    +----+
```

The preceding example shows:
- Member ID 1 Link 1 is connected to Member ID 2 Link 1.
- Member ID 2 Link 2 is connected to Member ID 3 Link 1.
- Member ID 3 Link 2 is connected to Member ID 4 Link 1.
- Member ID 4 Link 2 is connected to Member ID 5 Link 1.
- Member ID 5 Link 2 is connected to Member ID 6 Link 1.
- Member ID 6 Link 2 is connected to Member ID 8 Link 2.
- Member ID 8 Link 1 is connected to Member ID 7 Link 2.
- Member ID 3 is current VSF standby.
- Member ID 7 is current VSF commander.

**NOTE:** Set the terminal width to 100 for a better alignment of the topology diagram. Default width: 80.

**show vsf topology detail**

**Syntax**

```
show vsf topology detail
```

**Description**

This command displays forwarding path information (unidestination and multidestination flood path information). The unidestination forwarding takes the shortest path in terms of hop counts to reach destination member. The command output provides the egress VSF link used to send traffic along the shortest path computed. The multidestination path provides the complete flood path taken along the VSF stack for the multidestination traffic ingressing VSF stack or sourced at any VSF member.

**Example output**

```
switch# show vsf topology detail
Uni-destination Link Path:
<table>
<thead>
<tr>
<th>VSF Member ID</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>-</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>2</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>-</td>
<td>2</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>
```
In the preceding example, the unidestination traffic from Member ID 1 to Member ID 8 egresses through VSF link 1. Member ID 2 to Member ID 8 egresses through VSF link 2. Member ID 3 to Member ID 8 egresses through VSF link 3, and so on.

### Multi-destination Path:

<table>
<thead>
<tr>
<th>VSF Member ID</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2-3-4-5-6-8-7</td>
</tr>
<tr>
<td>2</td>
<td>1, 3-4-5-6-8-7</td>
</tr>
<tr>
<td>3</td>
<td>2-1, 4-5-6-8-7</td>
</tr>
<tr>
<td>4</td>
<td>3-2-1, 5-6-8-7</td>
</tr>
<tr>
<td>5</td>
<td>4-3-2-1, 6-8-7</td>
</tr>
<tr>
<td>6</td>
<td>5-4-3-2-1, 8-7</td>
</tr>
<tr>
<td>7</td>
<td>8-6-5-4-3-2-1</td>
</tr>
<tr>
<td>8</td>
<td>7, 6-5-4-3-2-1</td>
</tr>
</tbody>
</table>

In the preceding example, the multidestination traffic:

- ingressing at Member ID 1 will be relayed to Member ID 2, Member ID 2 will further relay to Member ID 3, Member ID 3 will further relay to Member ID 4, Member ID 4 to Member ID 5, Member ID 5 to Member ID 6, Member ID 6 to Member ID 8, and Member ID 8 to Member ID 7, which will not relay further. All the receiving Members will consume multidestination traffic before relaying further.

- ingressing or sourced at Member 2 will take two forwarding paths:
  - Relay to Member ID 1. Member ID 1 will consume and not relay further.
  - Relay to Member ID 3 which will further relay to Member ID 4, Member ID 4 to Member ID 5, Member ID 5 to Member ID 6, Member ID 6 to Member ID 8, and Member ID 8 to Member ID 7, which will not relay further.

**show vsf topology change-history**

**Syntax**

```text
show vsf topology <change-history>
```

**Description**

This command is used to display last 16 topology changes which occurred in the VSF stack and all topology transitions which occurred in recent history, along with details on which specific VSF member or link pair witnessed the state transitions.

**Parameters**

`<change-history>`

Show VSF stack topology changes.

**Example output**

```text
Switch# show vsf topology change-history
Thu Apr 21 00:06:10 2017 : The link between Member 4, Link 2 and Member 3, Link 2 went UP
Thu Apr 21 00:06:10 2017 : The link between Member 3, Link 2 and Member 4, Link 2 went UP
Thu Apr 21 00:06:09 2017 : The link between Member 3, Link 1 and Member 2, Link 1 went UP
```
Thu Apr 21 00:06:09 2017 : The link between Member 2, Link 1 and Member 3, Link 1 went UP

Thu Apr 21 00:04:07 2017 : The link between Member 2, Link 2 and Member 1, Link 2 went UP

Thu Apr 21 00:04:07 2017 : The link between Member 1, Link 2 and Member 2, Link 2 went UP

**show vsf lldp-mad**

**Syntax**

show vsf lldp-mad {parameters|status}

**Description**

Display the VSF LLDP MAD (Multi-Active Detection) information.

**Parameters**

- **parameters**
  
  Displays the MAD-assist configuration as well as the readiness state.

- **status**
  
  Displays the current state of the MAD probe.

**Example output**

Switch# show vsf lldp-mad parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAD device IP</td>
<td>134.1.5.29</td>
</tr>
<tr>
<td>MAD readiness status</td>
<td>Success</td>
</tr>
<tr>
<td>MAD device MAC</td>
<td>08:12:2b:40:44:3a</td>
</tr>
<tr>
<td>Reachable via Vlan</td>
<td>10</td>
</tr>
<tr>
<td>Local LAG interface</td>
<td>TRK5</td>
</tr>
<tr>
<td>MAD-probe portset</td>
<td>1, 7, 23</td>
</tr>
<tr>
<td>LAG connectivity</td>
<td>Full</td>
</tr>
</tbody>
</table>

Switch# show vsf lldp-mad status

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAD device IP</td>
<td>134.1.5.29</td>
</tr>
<tr>
<td>MAD probe portset</td>
<td>1, 7, 23</td>
</tr>
<tr>
<td>VSF split</td>
<td>Yes</td>
</tr>
<tr>
<td>MAD probe originator</td>
<td>Yes</td>
</tr>
<tr>
<td>Number of probe requests sent</td>
<td>3</td>
</tr>
<tr>
<td>Number of probe responses received</td>
<td>0</td>
</tr>
<tr>
<td>MAD Active Fragment</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**show vsf vlan-mad**

**Syntax**

show vsf vlan-mad

**Description**

Shows information for the VSF Multi-Active Detection (MAD) VLAN.

**VLAN MAD Connectivity status:**

**full**

All member VLAN MAD ports are connected to the MAD interconnect device.
At least one member VLAN MAD port is connected to the MAD interconnect device.

None of the member VLAN MAD ports are connected to the MAD interconnect device.

**Example output**

```
switch# show vsf vlan-mad

Multi-Active Detection VLAN status :

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>VLAN NAME</th>
<th>VLAN MAD Connectivity Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>VLAN200</td>
<td>Full</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Port</th>
<th>Status</th>
<th>Member State</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/8</td>
<td>Up</td>
<td>Standby</td>
</tr>
<tr>
<td>2/8</td>
<td>Up</td>
<td>Member</td>
</tr>
<tr>
<td>3/8</td>
<td>Up</td>
<td>Member</td>
</tr>
<tr>
<td>4/8</td>
<td>Up</td>
<td>Member</td>
</tr>
<tr>
<td>5/8</td>
<td>Up</td>
<td>Commander</td>
</tr>
<tr>
<td>6/8</td>
<td>Up</td>
<td>Member</td>
</tr>
<tr>
<td>7/8</td>
<td>Up</td>
<td>Member</td>
</tr>
<tr>
<td>8/8</td>
<td>Up</td>
<td>Member</td>
</tr>
</tbody>
</table>

If a MAD VLAN is not configured:

```
Switch(config)# show vsf vlan-mad
MAD VLAN is not configured
Switch(config)#
```

**show vsf trunk-designated-forwarder**

**Syntax**

```
show vsf trunk-designated-forwarder member <MEMBER-ID>
```

**Description**

Show the designated forwarders for each trunk.

**Parameters**

**<MEMBER-ID>**

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

**Example**

```
Switch# show vsf trunk-designated-forwarder member 1

Trunk Designated Forwarders

<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>Forwarding Member (Flood)</th>
<th>Forwarding Member (Unicast)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trk1</td>
<td>TRK</td>
<td>2</td>
<td>1, 2</td>
</tr>
<tr>
<td>Trk2</td>
<td>TRK</td>
<td>3</td>
<td>3, 4</td>
</tr>
</tbody>
</table>
```

**show cpu**

**Syntax**

```
show cpu <SECONDS>
```
Description
Show average CPU utilization.

Usage
show cpu slot <SLOT-LIST> [SECONDS]
show cpu process [slot <SLOT-LIST>] [refresh <COUNT>]

Example output

switch(config)# show cpu slot all

VSF slot 1/a:
----------
42 percent busy, from 300 sec ago
1 sec ave: 37 percent busy
5 sec ave: 36 percent busy
1 min ave: 49 percent busy

VSF slot 2/a:
----------
1 percent busy, from 300 sec ago
1 sec ave: 2 percent busy
5 sec ave: 1 percent busy
1 min ave: 2 percent busy

VSF slot 3/a:
----------
1 percent busy, from 300 sec ago
1 sec ave: 1 percent busy
5 sec ave: 1 percent busy
1 min ave: 1 percent busy

VSF slot 4/a:
----------
0 percent busy, from 300 sec ago
1 sec ave: 1 percent busy
5 sec ave: 1 percent busy
1 min ave: 1 percent busy

VSF slot 5/a:
----------
0 percent busy, from 300 sec ago
1 sec ave: 1 percent busy
5 sec ave: 1 percent busy
1 min ave: 1 percent busy

VSF slot 6/a:
----------
1 percent busy, from 300 sec ago
1 sec ave: 1 percent busy
5 sec ave: 1 percent busy
1 min ave: 1 percent busy

VSF slot 7/a:
----------
show power-over-ethernet

Syntax

show power-over-ethernet vsf member <MEMBER-ID>

Description

Show PoE information of specified VSF member.

Parameters

<MEMBER-ID>

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

Example

For `show power-over-ethernet vsf member 4`:

```
Switch# show power-over-ethernet vsf member 4
Status and Counters - System Power Status for member 4
Maximum Power       : 370 W           Operational Status  : On
Power In Use        : 0 W +/- 6 W     Usage Threshold (%) : 80
```

show system information

Syntax

show system information [vsf member <MEMBER-ID>]

Description

Show global configured and operational system parameters. If VSF is enabled, this shows the system information for all VSF members.

Parameters

<MEMBER-ID>

The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

Example

```
switch(config)# show system information
vsf Show global configured and operational system parameters of the specified VSF members.

switch(config)# show system information
Status and Counters - General System Information
```
<table>

show system information vsf member

Syntax

show system information vsf member <MEMBER-ID>

Description

Show global configured and operational system parameters of the specified VSF members.

Parameters

<MEMBER-ID>

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

Example output

switch# show system information vsf member 1

Status and Counters - General System Information

### VSF-Member: 8
show system fans

Syntax

show system fans [vsf member <MEMBER-ID>]

Description

Show system fan status. If VSF is enabled, this shows the system fan status for all VSF members.

Parameters

<MEMBER-ID>

The VSF member-ID for the member command parameter. Member ID value can be in the range of 1 to 8.

Example output

Aruba-VSF-2930F# show system fans

Fan Information

VSF-Member 1

<table>
<thead>

**show system chassislocate**

**Syntax**

```
show system chassislocate [vsf member <MEMBER-ID>]
```

**Description**

Show locator LED information. If VSF is enabled, this shows locator LED information for all the VSF members.

**Parameters**

*<MEMBER-ID>*

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

**Example output**

```
switch(config)# show system chassislocate

Locator LED Status

<table>
<thead>
<tr>
<th></th>
<th>Current</th>
<th>Time</th>
<th>Remaining</th>
<th>Configuration</th>
</tr>
</thead>
</table>
```
show system power-supply

Description
Show chassis power supply information. If VSF is enabled, this shows power supply information for all the VSF members.

Example output

```
switch# show system power-supply

Power Supply Status:

```

show uptime

Syntax
```
show uptime [vsf member <MEMBER-ID>]
```

Description
Display the elapsed time since the last boot of the specified member.

Parameters

```
<MEMBER-ID>
```

The VSF member-ID for the member command or parameter. Member ID value can be in the range of 1 to 8.

Example output

```
switch(config)# show uptime

VSF Virtual Chassis

35d 19h 45m

VSF Member 1
35d 19h 45m

VSF Member 2
35d 19h 45m

VSF Member 3
```
Support commands

**copy core-dump**

Copy core-dump from the specified VSF member. User can copy available core-dump file from interface module or management module.

**Syntax**

```
copy core-dump vsf member <MEMBER-ID> <SLOT-ID> | mm-active sftp | tftp | usb | xmodem <HOST-NAME-STR> | <IP-ADDR> | <IPV6-ADDR> <FILENAME-STR>
```

**Description**

The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

**Parameters**

- `<MEMBER-ID>`
  Specify the VSF member.
- `<SLOT-ID>`
  Copy interface module core-dump file.

**copy fdr-log**

Copy FDR (Flight data recorder) logs. User can either copy from management module or interface module or both.

**Syntax**

```
copy fdr-log vsf member <MEMBER-ID> all | mm-active sftp | tftp | usb | xmodem <HOST-NAME-STR> | <IP-ADDR> | <IPV6-ADDR> <FILENAME-STR>
```

**Description**

Copy FDR logs from the switch to an SFTP/TFTP server, USB, or xmodem terminal.

**Parameters**

- `<MEMBER-ID>`
  The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.
**copy crash-log**

**Syntax**

copy crash-log vsf member <MEMBER-ID> | <SLOT-ID-RANGE> | mm | sftp | tftp | usb | xmodem sftp | tftp | usb | xmodem <HOST-NAME-STR> | <IP-ADDR> | <IPV6-ADDR> <FILENAME-STR>

**Description**
Copy the switch log file.

**Parameters**

**<MEMBER-ID>**
The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

**<SLOT-ID-RANGE>**
Enter the single slot identifier.

**copy crash-data**

Copy the crash data file of the switch.

**Syntax**

copy crash-data vsf member <MEMBER-ID> | <SLOT-ID-RANGE> | mm | sftp | tftp | usb | xmodem sftp | tftp | usb | xmodem <HOST-NAME-STR> | <IP-ADDR> | <IPV6-ADDR> <FILENAME-STR>

**Description**
Copy the switch crash data file.

**Parameters**

**<MEMBER-ID>**
The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

**<SLOT-ID-RANGE>**
Enter the single slot identifier.

**show boot-history**

**Syntax**

show boot-history [vsf member <MEMBER-ID>]

**Description**
Display the system boot log for VSF.

**Parameters**

**<MEMBER-ID>**
The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.
**core-dump**
Enable/disable core-dump for the specified member. User can enable/disable core-dump for interface modules or management module.

**Syntax**
```
core-dump interfaces | management-module | vsf | tftp-server member <MEMBER-ID> interfaces | management-module
```

**Description**
Enable/disable core-dump on the management module or the interface module.

**Parameters**
- **interfaces**
  Enable/disable core dump on all the interfaces.
- **management-module**
  Enable/disable core-dump on the management module.
- **tftp-server**
  Address of the auto TFTP server to which the files will be uploaded.

**<MEMBER-ID>**
The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

**erase fdr-log vsf**
Erase FDR log from the specified member.

**Syntax**
```
erase fdr-log [vsf member <MEMBER-ID>] [slot | mm-active]
```

**Description**
Erase the FDR log files.

**Parameters**
- **<MEMBER-ID>**
The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

**copy crash-files**

**Syntax**
```
copy crash-files vsf member <MEMBER-ID> [<SLOT-ID-RANGE> | mm-active sftp | tftp | usb | xmodem] <HOST-NAME-STR> | <IP-ADDR> | <IPV6-ADDR> <FILENAME-STR>
```

**Description**
Copy the switch crash files from the specific VSF member

**Parameters**
- **mm-active**
  Copy active management module crash files.
The VSF member-ID for the member command or parameter. Member ID value can be in the range from 1 to 8.

Enter single slot identifier.

Usage
Switch(config)# copy crash-files vsf member
Switch(config)# copy crash-files vsf member 1

VSF configuration

There are two methods to configure VSF for a switch:

- Manual configuration. See Manual configuration of a VSF.

Manual configuration of a VSF

Prerequisites
Manual configuration of a VSF requires the user to individually configure every switch in the stack, and enable VSF on each switch independently. This process provides the best control for the user to configure VSF member number, priority, and VSF links.
It is recommended to have a software version greater than or equal to 16.06.XXXX on all switches, to form a stack of size greater than four members.

**Figure 107: An eight-member ring setup**

**Procedure**

1. To form an eight-member ring setup as shown, do not make the connections initially.
   The ports on each switch are Ethernet ports, and connecting as described will create a network loop. The ports are connected only after each device is fully configured.

2. Log in to the first device, numbered 1. This is configured as VSF stack member 1.
   
   a. At the prompt, enter the following commands:

   ```
   Switch# configure
   Switch(config)# vsf member 1 priority 200
   ```
Switch(config)# vsf member 1 link 1 24
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 1 link 2 23
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

b. The above sequence of commands will configure the switch as member 1, with priority 200. Since this switch has the highest priority configured, it becomes the Commander. The ports 23 and 24 are configured on VSF links 2 and 1 respectively.

3. Log in to the second device, numbered 2. It is configured as VSF member 2.

a. Physically connect member 2 with member 1 over the configured VSF ports, and execute the following commands.

Switch# configure
Switch(config)# vsf member 2 priority 150
Switch(config)# vsf member 2 link 1 25
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 2 link 1 24
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

b. The preceding sequence of commands will configure the member 2 with priority 150.

4. Log in to the third and fourth devices (configured as members 3 and 4 respectively).

a. Physically connect member 3 with member 2. Enter the following commands on device 3:

Switch# configure
Switch(config)# vsf member 3 priority 100
Switch(config)# vsf member 3 link 1 26
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 3 link 2 25
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

b. Physically connect member 4 with member 3. Enter the following commands on device 4:

Switch# configure
Switch(config)# vsf member 4 priority 100
Switch(config)# vsf member 4 link 1 27
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 4 link 2 26
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

5. Log in to the fifth and sixth devices (configured as members 5 and 6 respectively).

a. Physically connect member 5 with member 4. Enter the following commands on device 5:
Switch# configure
Switch(config)# vsf member 5 priority 100
Switch(config)# vsf member 5 link 1 28
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 5 link 2 27
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

b. Physically connect member 6 with member 5. Enter the following commands on device 6:

Switch# configure
Switch(config)# vsf member 6 priority 100
Switch(config)# vsf member 6 link 1 29
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 6 link 2 28
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

6. Log in to the seventh and eighth devices (configured as members 7 and 8 respectively).

a. Physically connect member 7 with member 6. Enter the following commands on device 7:

Switch# configure
Switch(config)# vsf member 7 priority 100
Switch(config)# vsf member 7 link 1 30
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 7 link 2 29
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

b. Physically connect member 8 with one link to member 1 and another to member 7. Enter the following commands on device 8:

Switch# configure
Switch(config)# vsf member 8 priority 100
Switch(config)# vsf member 8 link 1 23
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 8 link 2 30
All configuration on this port has been removed and port is placed in VSF mode.
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

The remaining six members have priority set to 100. All the eight switches will be configured to use the same domain ID: 5472, which will make a single stack.

7. Connect the switches together as shown. Enable VSF on each of the eight switches by executing the `vsf enable domain 5472` command. Multiple reboots of the switches may occur since the switch roles change when connected together. To prevent this, the user can power off all switches, connect the cables, and power on together. The stack will form directly.

8. The final VSF stack configuration after the stack formation will be:
Switch# show vsf
VSF Domain ID  : 5472
MAC Address    : b05ada-961103
VSF Topology   : Ring
VSF Status     : Active
Uptime         : 0d 2h 26m
VSF MAD        : None
VSF Port Speed : 1G
Software Version : WC.16.03.0000x

Mbr ID  MAC Address   Model                                  Pri Status
--- ------------- -------------------------------------- --- ----------
1  b05ada-961100 Aruba JL253A 2930F-24G-4SFP+ Switch    200 Commander
*2 b05ada-9721c0 Aruba JL260A 2930F-48G-4SFP Switch     150 Standby
3  b05ada-972200 Aruba JL254A 2930F-48G-4SFP+ Switch    100 Member
4  b05ada-96f080 Aruba JL259A 2930F-24G-4SFP Switch     100 Member
5  9cdc71-393440 Aruba JL253A 2930F-24G-4SFP+ Switch    100 Member
6  b05ada-962180 Aruba JL260A 2930F-48G-4SFP Switch     100 Member
7  b05ada-9631e0 Aruba JL254A 2930F-48G-4SFP+ Switch    100 Member
8  b05ada-96f000 Aruba JL259A 2930F-24G-4SFP Switch     100 Member

It indicates an eight-member VSF stack, with domain ID 5472. The stack topology is a ring, and the stack interconnect ports are of 1G speed. The user is connected to the console of member 2.

NOTE: The user can alternatively add a port to a VSF link keeping it in disabled state using vsf member 1 link 1 24 start-disabled command. It is helpful when the user wants to keep the VSF ports disabled, make the connections, and then enable them back. However, VSF ports on each member have to be individually enabled for the stack formation.

**Manual configuration with multiple ports bundled in a VSF link**

In manual configuration of a switch with multiple ports bundled in a VSF link, up to eight VSF ports can be aggregated in a single VSF link. This creates a load-balanced aggregate VSF connection with redundancy.

NOTE: This method is applicable for a VSF stack having more than four members too.

Figure 108: Manual configuration with multiple ports bundled in a VSF link
Procedure

1. Log in to the first device. This will be configured as VSF member 1. At the prompt, enter the following commands:

   ```
   Switch# configure
   Switch(config)# vsf member 1 priority 200
   Switch(config)# vsf member 1 link 1 49-52
   All configuration on this port has been removed and port is placed in VSF mode.
   Switch(config)# vsf member 1 link 2 21-24
   All configuration on this port has been removed and port is placed in VSF mode.
   Switch(config)# vsf enable domain 5472
   To enable VSF, the REST interface will be disabled.
   This will save the current configuration and reboot the switch.
   Continue (y/n)? y
   ```

   The above sequence of commands will configure the switch as member 1, which will boot as the Commander with priority 200.

   ```
   Switch# show vsf
   VSF Domain ID : 5472
   MAC Address : b05ada-961103
   VSF Topology : No Stack Formed
   VSF Status : Active
   Uptime : 0d 3h 22m
   VSF MAD : None
   VSF Port Speed : 1G
   Software Version : WC.16.03.0000x
   
   Mbr
   ID  MAC Address   Model                                  Pri Status
   --- ------------- -------------------------------------- --- ---------------
   *1  b05ada-961100 Aruba JL253A 2930F-24G-4SFP+ Switch    200 Commander
   ```

2. Log in to the second device. This will be configured as VSF member 2. At the prompt, enter the following commands:

   ```
   Switch# configure
   Switch(config)# vsf member 2 priority 150
   Switch(config)# vsf member 2 link 1 49-52
   All configuration on this port has been removed and port is placed in VSF mode.
   Switch(config)# vsf member 2 link 2 21-24
   All configuration on this port has been removed and port is placed in VSF mode.
   Switch(config)# vsf enable domain 5472
   To enable VSF, the REST interface will be disabled.
   This will save the current configuration and reboot the switch.
   Continue (y/n)? y
   ```

   The above sequence of commands will configure switch 2 as the Standby, with a priority of 150. Connect links of switch 1 and switch 2 after executing the `vsf enable domain` command. A 2-member stack will be formed.

   ```
   Switch# show vsf
   VSF Domain ID : 5472
   MAC Address : b05ada-961103
   VSF Topology : Chain
   ```
3. Log in to the third and fourth devices. These will be configured as members 3 and 4 respectively. Enter the following commands on device 3:

```
Switch# configure
Switch(config)# vsf member 3 priority 100
Switch(config)# vsf member 3 link 1 21-24
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 3 link 2 49-52
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf enable domain 5472
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y
```

The above sequence of commands will configure switch 3 as a Member, with a priority 100. Connect the links of switch 2 and switch 3 after executing the `vsf enable domain` command. A 3-member stack will be formed.

```
Switch# show vsf
```

```
VSF Domain ID    : 5472
MAC Address      : b05ada-961103
VSF Topology     : Chain
VSF Status       : Active
Uptime           : 0d 3h 22m
VSF MAD          : None
VSF Port Speed   : 1G
Software Version : WC.16.03.0000x
```

Enter the following commands on device 4:

```
Switch# configure
Switch(config)# vsf member 4 priority 100
Switch(config)# vsf member 4 link 1 49-52
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 4 link 2 21-24
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf enable domain 5472
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y
```
The above sequence of commands will configure switch 4 as a Member, with a priority 100. Connect links between switch 3 and switch 4, and switch 4 and switch 1, after executing the `vsf enable domain` command on switch 4. A 4-member stack will now be formed with four ports bundled in a single VSF link.

```
Switch# show vsf

VSF Domain ID : 5472
MAC Address     : b05ada-961103
VSF Topology    : Ring
VSF Status      : Active
Uptime          : 0d 3h 22m
VSF MAD         : None
VSF Port Speed  : 1G
Software Version: WC.16.03.0000x

Mbr ID  MAC Address   Model                                  Pri Status
      ------------- -------------------------------------- --- ---------------
*1  b05ada-961100 Aruba JL253A 2930F-24G-4SFP+ Switch    200 Commander
  2  b05ada-9721c0 Aruba JL260A 2930F-48G-4SFP Switch     150 Standby
  3  b05ada-972200 Aruba JL254A 2930F-48G-4SFP+ Switch    100 Member
  4  b05ada-96f080 Aruba JL259A 2930F-24G-4SFP Switch     100 Member
```

4. The `show vsf link` command will display an output of VSF port state and links for each VSF member.

**Automatic configuration of a VSF fabric**

Automatic configuration of a VSF is simpler than the manual configuration, as it only requires the user to log in and configure one switch. The other switches automatically get their configurations from the first switch, but only if the switches are in factory default state. Automatic configuration is not supported on switches that have been previously deployed, or have had any configuration change made to them, over either CLI, web, or SNMP. A switch may be restored to factory default state by using the CLI command `erase startup-configuration` command.

---

**NOTE:** The following configuration methods can be applied to a stack having more than four members too.

Automatic configuration of a VSF can be configured using two methods:

- without provisioning
- with provisioning
  - Chassis type, called loose provisioning
  - Chassis type and MAC-address, called strict provisioning

**Without provisioning:**

1. Do not connect the ports initially. Since the ports are Ethernet ports, connecting them in a ring topology can cause loops. Note down the J-number & MAC address of each switch. The J-number is available on the front panel of the switch while the MAC address is available on the back panel of the switch.

2. Connect to the console of the member intended to be the commander (member 1 in this example). To enable VSF on the member, execute the following commands:

```
Switch# configure
Switch(config)# vsf member 1 priority 200
Switch(config)# vsf member 1 link 1 22
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 1 link 2 23
```
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf enable domain 3144
To enable VSF, the REST interface will be disabled.
This will save the current configuration and reboot the switch.
Continue (y/n)? y

The preceding sequence of commands will configure the switch as member 1, with priority 200. The ports 22 and 23 are configured on VSF links 1 and 2 respectively. VSF is now enabled. The domain must be specified while enabling VSF.

3. Upon reboot, the switch is a one-member stack. Execute the `show vsf` command:

```
Switch# show vsf
VSF Domain ID : 3144
MAC Address    : b05ada-961103
VSF Topology   : No Stack Formed
VSF Status     : Active
Uptime         : 0d 3h 22m
VSF MAD        : None
VSF Port Speed : 1G
Software Version : WC.16.03.0000x

Mbr ID  MAC Address   Model                                  Pri Status
--- ------------- -------------------------------------- --- ---------------
*1 b05ada-961100 Aruba JL253A 2930F-24G-4SFP+ Switch 200 Commander
```

4. Physically connect the switch with default configuration to the configured VSF links on member 1. The new switch will automatically reboot to join the stack as the Standby.

```
Switch# show vsf
VSF Domain ID : 3144
MAC Address    : b05ada-961103
VSF Topology   : Chain
VSF Status     : Active
Uptime         : 0d 3h 22m
VSF MAD        : None
VSF Port Speed : 1G
Software Version : WC.16.03.0000x

Mbr ID  MAC Address   Model                                  Pri Status
--- ------------- -------------------------------------- --- ---------------
*1 b05ada-961100 Aruba JL253A 2930F-24G-4SFP+ Switch 200 Commander
  2 b05ada-9721c0 Aruba JL260A 2930F-48G-4SFP Switch 150 Standby
```

5. Configure link 2 of the newly joined member and connect switch 3 with default configuration, to the link 2 of member 2 (Standby). The new member will automatically reboot and join the stack as member 3.

```
Switch# show vsf
VSF Domain ID : 3144
MAC Address    : b05ada-961103
VSF Topology   : Chain
VSF Status     : Active
Uptime         : 0d 3h 22m
VSF MAD        : None
VSF Port Speed : 1G
Software Version : WC.16.03.0000x

  2 b05ada-9721c0 Aruba JL260A 2930F-48G-4SFP Switch 150 Standby
  3 b05ada-9639c0 Aruba JL253A 2930F-24G-4SFP Switch 150 Standby
```
6. All switches can be now interconnected and powered on.

With provisioning:

1. Do not connect the ports initially. Since the ports are Ethernet ports, connecting them in a ring topology can cause loops. Note down the J-number & MAC address of each switch. The J-number is available on the front panel of the switch while the MAC address is available on the back panel of the switch.

2. Connect to the console of the member intended to be the commander (member 1 in this example). To enable VSF on the member, execute the following commands:

   Switch# configure
   Switch(config)# vsf member 1 priority 200
   Switch(config)# vsf member 1 link 1 22
   All configuration on this port has been removed and port is placed in VSF mode.
   Switch(config)# vsf member 1 link 2 23
   All configuration on this port has been removed and port is placed in VSF mode.
   Switch(config)# vsf enable domain 3144
   To enable VSF, the REST interface will be disabled. This will save the current configuration and reboot the switch.
   Continue (y/n)? y

   The preceding sequence of commands will configure the switch as member 1, with priority 200. The ports 22 and 23 are configured on VSF links 1 and 2 respectively. VSF is now enabled. The domain must be specified while enabling VSF.

3. Upon reboot, the switch is a one-member stack. Execute the `show vsf` command:

   Switch# show vsf

<table>
<thead>
<tr>
<th>VSF Domain ID</th>
<th>MAC Address</th>
<th>VSF Topology</th>
<th>VSF Status</th>
<th>Uptime</th>
<th>VSF Port Speed</th>
<th>Software Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>3144</td>
<td>b05ada-961103</td>
<td>No Stack Formed</td>
<td>Active</td>
<td>0d 3h 22m</td>
<td>1G</td>
<td>WC.16.03.0000x</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Mbr ID</th>
<th>MAC Address</th>
<th>Model</th>
<th>Pri Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>*1</td>
<td>b05ada-961100</td>
<td>Aruba JL253A 2930F-24G-4SFP+ Switch</td>
<td>200 Commander</td>
</tr>
</tbody>
</table>

4. Provision the configuration for each of the other switches. Provisioning allows the user to specify the type of each switch in the stack. Once provisioned, the user can make configuration changes on ports of the switch. When the switch joins the stack, it will automatically get any configuration made. Provision member 2:
Switch# configure
Switch(config)# vsf member 2 type JL260A mac-address b05ada-9721c0
This will save the current configuration. Continue (y/n)? y
Warning - The link and port should be provisioned for member 2 to join the VSF stack.
Switch(config)# vsf member 2 priority 150
Switch(config)# vsf member 2 link 1 2/22
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 2 link 2 2/23
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)#

The member number, switch type, and MAC address are specified first. Once this command is executed, the ports of the switch are now available to be configured, as 2/1, 2/2 and so on. The links of member 2 are also provisioned, using ports 2/22 and 2/23 on links 1 & 2 respectively. The provisioned switch also shows up in the stack configuration:

Switch# show vsf
VSF Domain ID : 3144
MAC Address : b05ada-961103
VSF Topology : No Stack Formed
VSF Status : Active
Uptime : 0d 3h 22m
VSF MAD : None
VSF Port Speed : 1G
Software Version : WC.16.03.0000x

Mbr
ID  MAC Address   Model                                  Pri Status
--- ------------- -------------------------------------- --- ---------------
*1  b05ada-961100 Aruba JL253A 2930F-24G-4SFP+ Switch    200 Commander
2  b05ada-9721c0 Aruba JL260A 2930F-48G-4SFP Switch     150 Provisioned

5. The same procedure is repeated to provision switches 3 & 4 too. To continue configuring and provisioning switches 3 & 4, enter the following commands on the console:

Switch(config)# vsf member 3 type JL254A mac-address b05ada-972200
This will save the current configuration. Continue (y/n)? y
Warning - The link and port should be provisioned for member 3 to join the VSF stack.
Switch(config)# vsf member 3 link 1 3/46
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 3 link 2 3/47
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 4 type JL259A mac-address b05ada-96f080
This will save the current configuration. Continue (y/n)? y
Warning - The link and port should be provisioned for member 4 to join the VSF stack.
Switch(config)# vsf member 4 link 1 4/46
All configuration on this port has been removed and port is placed in VSF mode.
Switch(config)# vsf member 4 link 2 4/47
All configuration on this port has been removed and port is placed in VSF mode.

The provisioned switch also shows up in the stack configuration:
Switch# show vsf

VSF Domain ID    : 3144
MAC Address      : b05ada-961103
VSF Topology     : No Stack Formed
VSF Status       : Active

3  b05ada-972200 Aruba JL254A 2930F-48G-4SFP+ Switch    128 Provisioned
4  b05ada-96f080 Aruba JL259A 2930F-24G-4SFP Switch     128 Provisioned

6. All switches can be now interconnected and powered on. Connect all the switches as shown:

Procedure

1. After the connections have been made, power on switch 2 and 4. These switches will boot up normally as a standalone switch with the default configuration.

2. The VSF enabled switch will push down the VSF configuration information to the other switches over the VSF link ports.

3. Since switches 2 and 4 are the directly connected switches, they will receive their configuration first, and reboot. This procedure takes between 30 seconds to 1 minute.

4. Once switches 2 & 4 have joined the stack, power on switch 3.

5. VSF configuration will be pushed to switch 3. It will reboot last, and join the stack. The final stack configuration will now include all switches.

Switch# show vsf

</tbody>
</table>

NOTE: In this scenario, specifying the MAC address of each provisioned switch is optional. If the MAC address is not specified, the switch is termed a loose-provisioned switch. When the commander configures a switch connected on a VSF link port, it will find the first provisioned switch which matches the J-number, and push the configuration to the connected switch.

**Port speed**

The 2930 switches support only one port speed across all VSF ports in the stack. This port speed is configurable, and is initially set automatically to the highest speed capable by the first VSF port that is configured.

Users can add ports of any speed to a VSF link. Only ports which match the configured VSF port speed will link up in the VSF stack. Ports which do not match the VSF port speed will be in an error state, stating port speed mismatch. This new feature allows users to migrate a stack based on 1G interconnects to a stack based on 10G interconnects, and vice-versa, without having to reform the VSF stack from the beginning. The migration procedure from 1G interconnects to 10G interconnects is:

In a stack with 1G interconnects, the user simply adds the 10G ports to each link. These ports should also be physically interconnected, but they will not link up. Once all the configuration is complete and the interconnections are made, the user changes the port speed using the command `vsf port-speed 10g`. This triggers a reboot of the stack, and once the stack is reformed, it uses the configured 10G ports while the 1G ports will be in error state. The 1G ports can now be disconnected and unconfigured.

NOTE: In the case of transceiver ports, the speed is determined by the bay type. An SFP+ bay, if configured, will set port speed to 10G. If an SFP transceiver is inserted into the bay, it will not link up and be in error state.

**VSF port LED front panel**

On enabling the VSF link ports, the LED flashes solid orange state in the front panel. The user can recognize and connect the VSF link ports. Solid orange LED state indicates:

- Port is reserved.
- Port is reserved but disabled.
- Port is reserved and not linked up. The port LED starts showing activity by flashing green when it links up to the partner port, and successfully forms the VSF stack.

Selecting **Usr** in the front panel displays stack member information. For example:

- Port1 LED indicates status of Stack Member 1.
- Port2 LED indicates status of Stack Member 2.

### Diagnostic tips for stacking error
LED 1 and LED 2 display solid green color, whereas, LED 3 displays solid orange

Symptom
LED 1 and LED 2 display solid green color, whereas, LED 3 is off.  

Cause
Stacking is disabled on the switch. The member is unreachable or booting.

Action
1. Connect a console cable to the switch and establish a console session.
2. Enter `vsf enable domain <ID>` from the CLI config context.
3. Recheck the switch LEDs:
   Stacking port LED is back to solid green. Port LED in user mode is green.

LED 1 displays slow flash orange, LED 2 displays solid green, whereas, LED 3 displays different colors

Symptom
LED 1 displays slow flash orange and LED 2 displays solid green. LED 3 displays slow flash green, fast flash green, slow flash orange, or solid green.

Cause
The interface cable is connected to the VSF port on which the link LED is blinking.

Action
1. Make sure that the stacking cable is fully connected at both ends of the link.
2. If an equipment failure has occurred, see the LEDs on the device at the other end of the connection.

Solution 2

Cause
A stacking link failure has occurred on a link that was functioning:
- The switch at the other end of the VSF port cable has been powered off.
- The stacking feature is disabled on the switch at the other end of the VSF port cable.
- The cable is faulty.
Action

1. If this error occurred on an operational stack, it could result in changes to the stack configuration. This can include election of a new stack commander and possibly a new standby. Ensure that the correct set of supported cabling is used for installed transceivers or RJ45 fixed port.

2. See the Stack Management chapter in the 2930F Advance Traffic Management Guide for more information. Contact your Hewlett Packard Enterprise authorized network reseller, or use the electronic support services from Hewlett Packard Enterprise to get assistance. See www.hpe.com/support/hpesc.

LED 1 displays slow flash orange and LED 2 displays solid green color, whereas, LED 3 displays different colors

Symptom

LED 1 displays slow flash orange and LED 2 displays solid green color. LED 3 displays slow flash green, fast flash green, or slow flash orange.¹

¹ LED 1 is Global Status LED, LED 2 is Mode LED Usr, and LED 3 is Port LED.

Cause

A stack link failure has occurred in a chain topology and multiple stack fragments have been created. Each fragment will elect a Commander, so there will be multiple switches with the Cmd LED on.

Action

1. Repair the cause of the stack link failure.

2. Reconnect the switches in their original topology so that the switches can reform the original stack.

LED 1 and LED 2 display solid green, whereas, LED 3 displays different colors

Symptom

LED 1 and LED 2 display solid green, whereas, LED 3 displays slow flash green and fast flash green.¹

¹ LED 1 is Global Status LED, LED 2 is Mode LED Usr, and LED 3 is Port LED.

Cause

Merging two stacks that have different stack IDs which were not previously part of the same stack.

Action

1. Select one of the stacks as the one to retain.

2. Erase the stacking configuration for each switch in the other stack by issuing stacking factory-reset at the config level. The startup configuration for each switch is erased, including the stacking configuration.

3. Add the switches to the stack as described in the Stack Management chapter of the ArubaOS-Switch Advanced Traffic Management Guide K/KA/KB.16.01.
### Locating LED behavior in stacking system

**Table 40: Locating LED behavior in stacking system**

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>Stack split and merge</td>
<td>Locate LED indication is restored once merged back into stack.</td>
</tr>
</tbody>
</table>

**NOTE:**

**Unsupported XCVR behavior**

When unsupported transceiver is installed or hotswapped on the VSF reserved port, it flashes slow orange, indicating that the transceiver has failed validation.

**Port or Link LED behavior**

When VSF is reserved, it flashes solid orange, indicating port state as reserved, but moves on to flash green, showing activity when linked up successfully.

**Mode LED set to PoE on VSF enabled Port**

PoE is disabled by default on VSF port, hence it indicates slow flash orange on VSF port when POE mode LED is selected.
VSF restrictions

- VSF is mutually exclusive with distributed trunking, mesh, and Q-in-Q.
- VSF port restrictions:
  - Must be 10Gbps/1Gbps.
  - A VSF link can only comprise ports with the same speed; either all 10G or all 1G. A VSF port speed which does not match with the global port speed, will be in a down state. The command `show vsf link detail` will display an error message.
  - Maximum eight ports can be configured on one VSF link.
  - VSF ports must be directly connected and there should be no transit devices between members.
- In a VSF virtual chassis, flow-control is not supported between ports on different chassis across VSF links.
- A VSF stack downgrade is not allowed if we try to downgrade a 2930 VSF stack having a stack size greater than four members, to an image lesser than 16.06.
- For switches running software versions lesser than 16.06, it is recommended to first upgrade to 16.06 for supporting a stack having more than four members.
- VSF merge between a fragment running a software version 16.06 and a fragment running an image lesser than 16.06 is not recommended.
- A power outage or cable connection failures can split a stack with greater than four members, into more than two fragments (for example, 1-2-3-4, 5-6, and 7-8). To restore the stack to its previous state after addressing the issues, ensure that not more than two fragments are merged at a time. For example, merge 1-2-3-4 with 5-6, followed by merging 1-2-3-4-5-6 with 7-8.

VSF Use Cases

Use Case 1: Multiple Active Detection

What is MAD?

Multiple Active Detection (MAD) is a protection mechanism against the fallout of a VSF stack split. A stack split occurs when there is a connectivity failure between the two stack switches. The simplest protection against connectivity failure is to have multiple redundant ports in the VSF link.

The two switches operate in a "split-brain" scenario. Both split fragments cannot talk to each other and are forwarding traffic, but:

- they have the same MAC address,
- they have the same IP addresses on all VLANs, and
- depending on the deployment, they are likely to be connected to same uplink/downlink switches though a link-aggregation.

A MAD protocol must be enabled to prevent network-wide issues that a stack split can cause. MAD protocols attempt to detect the presence of the other stack fragment. If detected, the goal of MAD is to keep only one stack
fragment up. The other stack fragment is brought down (all switch ports are disabled). This prevents issues caused by duplicate IP addresses and/or duplicate MAC address.

**Figure 109: MAD interconnect device**

![MAD interconnect device](image)

**NOTE:** Once a MAD decision has been accepted and the active member is determined, the member remains in the current state until the VSF fabric has been repaired.

**LLDP MAD**

LLDP-MAD is used to detect multiple-active VSF fragments. This protocol is not supported for more than 2–member stacking switches. When a VSF fabric existing between an active and a standby member fails, LLDP-MAD determines whether multiple active topology is in place. If LLDP-MAD is configured and a VSF split occurs, one of the VSF members will become inactive, which disables the non-VSF frontplane ports. This ensures that only one of the members will be actively forwarding traffic.

**Figure 110: LLDP-MAD**

![LLDP-MAD](image)

**MAD readiness check**

The MAD assist device must be connected over a LACP trunk interface to the VSF device. Once you configure the IP address of a MAD assist device, the VSF switch will perform a MAD readiness check to determine:

- If the MAD assist device is reachable.
- If a trunk interface is used to reach the device.
- If the trunk state is up.

If the above three conditions are not met, MAD will fail to detect dual active fragments during a VSF split. This error will create a log message.
NOTE: The MAD readiness check is repeated periodically. If MAD-probe parameters have changed, an appropriate message will be logged.

VLAN MAD

MAD VLAN can be used for management. Switches which support VSF and do not have OOBM ports, use front-plane ports to detect active stack fragments upon split. One port from each member of the stack should be part of a MAD VLAN and it should be connected to MAD interconnect device in the same network. MAD VLAN can be used for the purpose of management like telnet and SSH. The front-plane ports of switches which support only VSF will be part of one VLAN called MAD VLAN.

Limitations of VLAN MAD

- Any other protocol which may alter the functionality of VLAN MAD should not be enabled on VLAN MAD.
- Proper functionality of VLAN MAD cannot be ensured when there is more than one failure.
- Only one port per member can be assigned to the VLAN MAD.
- A source port filter cannot be configured on a port that is a member of the VLAN MAD.
- VLAN MAD cannot be configured on a VLAN that has source port filter enabled member ports.
- Trunk ports cannot be assigned to the VLAN MAD.
- The default VLAN cannot also be the VLAN MAD.
- GVRP cannot be configured on VLAN MAD member ports. Use the interface level unknown-vlans command to disable GVRP in ports.
- MVRP cannot be enabled on VLAN MAD member ports.
- VLAN MAD cannot be configured when multicast filter is enabled for MAC address 0x00, 0x12, 0x79, 0x4a, 0xd5, and 0x82.
- LACP enabled port cannot be part of the MAD VLAN.
- BPDU filtering cannot be disabled on MAD VLAN ports.

Use Case 2: Replacing a switch in a stack

A stack maintains the MAC address of all member switches in its configuration. This is to enable the stack to reform quickly upon reboot. In the event a failed switch needs to be replaced in the stack, the replacement switch will be considered as a new switch joining the stack, and will be assigned an unused member and a default configuration.

Switch# show vsf
VSF Domain ID : 164423
MAC Address   : b05ada-96f043
VSF Topology  : Chain
VSF Status    : Fragment Active
Uptime        : 0d 10h 30m
VSF MAD       : None
VSF Port Speed: 1G
Software Version : WC.16.03.0003

Mbr
ID  MAC Address       Model                                  Pri Status
--- ----------------- -------------------------------------- --- ---------------
1   b05ada-962160     Aruba JL253A 2930F-24G-4SFP+ Switch    128 Missing
*2  b05ada-96f040     Aruba JL253A 2930F-24G-4SFP+ Switch    250 Commander
In the above stack, member 1 has failed, and needs to be replaced. A replacement switch with the same model number (JL253A) will not take on the role of the switch it replaced, because the MAC address of the replacement switch will be different from the switch that it replaces.

To enable the configuration to assimilate the replacement switch as member 1 in the stack, the MAC address needs to be cleared. Use the CLI command `vsf member 1 type JL253A`. This will retain all configuration made on member 1 and remove only the MAC address. After the command is executed, the output of `show vsf` will be as follows:

<table>
<thead>
<tr>
<th>Mbr ID</th>
<th>MAC Address</th>
<th>Model</th>
<th>Pri Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>b05ada-96f040</td>
<td>Aruba JL253A 2930F-24G-4SFP+ Switch</td>
<td>128 Provisioned</td>
</tr>
<tr>
<td>2*</td>
<td>b05ada-96f043</td>
<td>Aruba JL253A 2930F-24G-4SFP+ Switch</td>
<td>250 Commander</td>
</tr>
<tr>
<td>3</td>
<td>b05ada-973680</td>
<td>Aruba JL262A 2930F-48G-PoE+-4SFP Switch...</td>
<td>250 Standby</td>
</tr>
<tr>
<td>4</td>
<td>b05ada-963860</td>
<td>Aruba JL261A 2930F-24G-PoE+-4SFP Switch...</td>
<td>128 Member</td>
</tr>
</tbody>
</table>

Subsequently, any switch model under JL253A, which is connected to the stack, will be assigned member 1 configuration and role.

**Use Case 3: Changing VSF link speed**

The sequence to change the VSF link speed is as follows:

**Prerequisites**

VSF requires that all ports in all VSF links in the VSF stack must be of the same speed. VSF supports two port speeds, 1G and 10G, and up to 8 ports can be added to a VSF link. There is no default port speed defined. When a VSF link is first configured, the global port speed is automatically set to the interface speed of the port on the link.

- There is no restriction on the ports which can be added to a VSF link. Ports which do not match the global port speed can be added to a VSF link, but only ports matching the configured global port speed will be up.
- On a running VSF stack, the current applicable port speed is shown as part of the `show vsf` command output.

```
Switch(config)# show vsf
VSF Domain ID : 164423
MAC Address   : b05ada-96f043
VSF Topology  : Chain
VSF Status    : Active
Uptime        : 0d 5h 37m
VSF MAD       : None
VSF Port Speed: 1G
Software Version : WC.16.03.0003
```

**Procedure**

1. Add ports of the desired link speed to each link of the stack.
Once this is done, the `show vsf link detail` output would be similar to:

```
VSF Member: 1     Link: 1
Port     State
-------- ----------------------------
1/1      Up   : Connected to port 4/1
1/25     Error: Port speed mismatch

VSF Member: 1     Link: 2
Port     State
-------- ----------------------------
1/2      Up   : Connected to port 2/2
1/26     Error: Port speed mismatch

VSF Member: 2     Link: 1
Port     State
-------- ----------------------------
2/1      Up   : Connected to port 3/1
2/25     Error: Port speed mismatch
```

2. Connect the ports of the new speed (1/25, 1/26, etc.). Since the ports are kept disabled, it is safe to make the connections at this point. The link will not come up. All links must have ports of both speeds, otherwise the link will fail to come up when the port speed is changed.

3. Execute the command indicating the target speed: `vsf port speed <1G/10G>`. This will trigger a reboot of the whole stack. On reboot, the stack will form using the ports which match the new VSF port speed. Ports which do not match will be kept disabled. The output of `show vsf link detail` after the reboot would be as follows:

```
VSF Member: 1     Link: 1
Port     State
-------- --------------------------
1/1      Error: Port speed mismatch
1/25     Up   : Connected to 4/25

VSF Member: 1     Link: 2
Port     State
-------- --------------------------
1/2      Error: Port speed mismatch
1/26     Up   : Connected to 2/26

VSF Member: 2     Link: 1
Port     State
-------- --------------------------
2/1      Error: Port speed mismatch
2/25     Up   : Connected to 3/25
```

4. Disconnect the unused ports (1/1, 1/2 etc.). This is a safety measure to avoid accidentally creating a network loop when executing the next step.

5. Unconfigure the unused ports from the VSF link, using the command `no vsf member 1 link 1 1/1 etc`. Once this step is completed, the output of `show vsf link detail` would be as follows:
The ports which have been removed from VSF links can now be used as regular Ethernet ports.

**Use Case 4: Adding a switch to a stack**

The automatic configuration mode only works with a newly unboxed switch, or a switch which has been reset to factory default configuration using the CLI command `erase startup-configuration`. Now, connecting the switch in between the two end switches of the chain will trigger an automatic configuration download to the switch, after which it will join the stack.

In manual configuration mode, the switch to be added has to be configured to join the stack. This involves the following steps:

**Prerequisites**

A functional running stack can be scaled up by adding a switch to increase capacity. There will be minimal disruption of switching function during this operation. This process is similar to the VSF deployment, and can be done in either Manual or Automatic configuration mode.

- **NOTE:** The maximum number of members in a VSF stack is 8.

- The first step is to convert running stack to chain, if it is in ring topology. To increase the stack size, add a new switch to the stack, and then convert it back to a ring.

- This involves disconnecting a VSF link between two stack members. Switching functions will continue, with possible loss of some in-flight traffic.

**Procedure**

1. Configure new switch links, which will be connected to the two end switches of the chain.
2. Enable VSF on new switch with the same Domain ID as the stack. This will cause the switch to reboot.
3. Connect the cables to the end switches of the stack, and the stack will be formed.

   There could again be some possible loss of some in-flight traffic as a ring topology forms from the chain topology.
Use Case 5: Stack split and merge

- Upon a merge, the inactive fragment will reboot and always join the stack.
- In an equal stack split, the fragment with the commander will always be active.
- In an unequal stack split, the fragment with higher number of members will always be active.

**NOTE:** Any topology change to an active fragment which is in a partial state will result in an undesirable behavior.
Overview

To simplify the deployment of mobility and IoT devices, Aruba switches have a mechanism to automatically detect devices based on their LLDP signatures and apply configuration to the port to which they are connected. This reduces the time needed to add, move, or change devices on the network and also eliminates potential misconfigurations on the port.

Device Profiles allow an administrator to create configuration containers for different classes of devices and associate them with certain device types. The configuration containers are stored as part of the config, but do not come into effect until a device with the right LLDP signature is connected to a port on that switch. Device profiles allow network administrators to apply port settings automatically, eliminating configuration mistakes as well as reducing the time taken to connect wired devices.

Organization-specific TLVs and subtypes that come as part of LLDP messages are used to detect and apply profiles to devices. A maximum of 16 devices can be detected and defined using Device Profiles. The following sections talk about the operational steps that need to be followed to add Mobility and IoT devices as well as features such as Rogue AP detection that can be used for mobile-first deployments with Aruba APs.

Auto configuring Aruba APs

The auto device detection and configuration detects a directly connected Aruba AP dynamically and applies predefined configurations to ports on which the Aruba AP is detected.

You can create port configuration profiles, associate them to a device type, and enable or disable a device type. One of the device types supported is aruba-ap and it is used to identify all the Aruba APs.

When a configured device type is connected on a port, the system automatically applies the corresponding port profile. Connected devices are identified using LLDP. When the LLDP information on the port ages out, the device profile is removed.

By default, the device profile feature is disabled. When you enable the device profile support for a device type, if no other device profile is mapped to the device type, the default device profile default-ap-profile is associated with the device type. You can modify the AP default device profile configuration but you cannot delete it. The default-ap-profile command supports only the AP device type.

**NOTE:** Only APs which are connected directly will be detected.

Associating a device with a profile

To associate an Aruba access point (AP) device-type to a user-defined profile, use the context `Switch(device-aruba-ap)#`. All Aruba access points use the identifier aruba-ap.

The `[no]` form of the command removes the device type association and disables the feature for the device type. The feature is disabled by default.

device-profile name

**Syntax**

```plaintext
[no] device-profile name <PROFILE-NAME> [untagged-vlan <VLAN-ID>] |
tagged-vlan <VLAN-LIST> | cos <COS-VALUE> |
ingress-bandwidth <Percentage> |
egress-bandwidth <Percentage> |
```
Description
This command is used to create a user-defined profile. A profile is a named collection of port settings applied as a group. You can modify the default profile, default-ap-profile, but you cannot delete it. You can create four additional profiles.

The default-ap-profile has the following values:

- **untagged-vlan**: 1
- **tagged-vlan**: None
- **ingress-bandwidth**: 100
- **egress-bandwidth**: 100
- **cos**: 0
- **speed-duplex**: auto
- **poe-max-power**: class/LLDP
- **poe-priority**: critical

You can modify these parameters. For example, you can execute no untagged-vlan to create a device profile with tagged only ports.

Parameters

**name**
Specifies the name of the profile to be configured. The profile names can be at most 32 characters long.

**cos**
The Class of Service (CoS) priority for traffic from the device.

**untagged-vlan**
The port is an untagged member of specified VLAN.

**tagged-vlan**
The port is a tagged member of the specified VLANs.

**allow-tunneled node**
Configuration to allow Tunneled Node when device profile is applied on port.

**ingress-bandwidth**
The ingress maximum bandwidth for the device port.

**egress-bandwidth**
The egress maximum bandwidth for the device port.

**poe-priority**
The PoE priority for the device port.

**speed-duplex**
The speed and duplex for the device port.
poe-max-power

The maximum PoE power for the device port. The value is set based on PD Class detection and/or LLDP negotiation. `poe-max-power` will have class appropriate value depending on the class of your AP. (Example: class4 = 25.5W, class 3=13W, class2=6.49W, class1=3.84W, class0=13W)

**Options**

no

Removes the user-defined profiles.

**Restrictions**

- You can modify the configuration parameters of the default profile, `default-ap-profile`, but you cannot delete it or change its name.
- Egress rate limiting is not supported for devices running on Aruba 2930F Switch Series.
- The profile configuration is only applicable to access points.

### device-profile type

From within the configure context:

**Syntax**

```
device-profile type <DEVICE> [associate <PROFILE-NAME> | enable | disable ]
```

**Description**

This command specifies an approved device type in order to configure and attach a profile to it. The profile’s configuration is applied to any port where a device of this type is connected.

**Approved device types**

- **aruba-ap**
  - Aruba access point device.
- **arubaos-switch**
  - ArubaOS switch

**Options**

From within the `device-aruba-ap` context

- **associate <PROFILE-NAME>**
  - Associated the specified device type by profile name.
- **enable**
  - Enables the automatic profile association.
- **disable**
  - Disables the automatic profile association.

**Usage**

```
[no] device-profile type <DEVICE> [associate <PROFILE-NAME> | enable | disable]
```

**NOTE:** The device types supported are `aruba-ap` and `arubaos-switch`. 
**device-profile type device-name**

**Syntax**

device-profile type [aruba-ap | aruba-switch | scs-wan-cpe | device-name <DEVICE-NAME> associate <PROFILE-NAME> | enable | disable]

no device-profile type [aruba-ap | aruba-switch | scs-wan-cpe | device-name <DEVICE-NAME> associate <PROFILE-NAME> | enable | disable]

**Description**

Associates the device profile with the type of device by identity.

The `no` form of this command removes the device profile from the device type.

**Command context**

`config`

**Parameters**

- **associate <PROFILE-NAME>**
  
  Selects the profile name associated with the device-type.

- **enable**
  
  Selects the profile of the device being enabled.

- **disable**
  
  Selects the profile of the device being disabled.

**Usage**

- The command `device-profile type aruba-ap enable` enables profile for Aruba-AP.

- Device Name is defined the same as Device Identity.

**show device-profile**

**Syntax**

Within the `configure` context:

`show device-profile`

**Description**

Show device profile configuration and status.

**config**

Show the device profile configuration details for a single, or all, profiles.

**status**

Show currently applied device profiles.

**Usage**

- `show device-profile config <PROFILE-NAME>`

- `show device-profile status`
show device-profile config

Switch# Show device-profile config
Device Profile Configuration

Configuration for device-profile : default-ap-profile
untagged-vlan : 1
tagged-vlan : None
ingress-bandwidth : 100%
egress-bandwidth : 100%
cos : None
speed-duplex : auto
poe-max-power : Class/LLDP
poe-priority : critical
allow-jumbo-frames : Disabled
allow-tunneled-node: Enabled

show device-profile config profile1

Switch(device-profile)# show device-p config test
Device Profile Configuration

Configuration for device-profile : profile1
untagged-vlan : 1
tagged-vlan : None
ingress-bandwidth : 100%
egress-bandwidth : 100%
cos : None

poe-max-power : Class/LLDP
poe-priority : critical
allow-jumbo-frames : Disabled
allow-tunneled-node: Enabled

show command device-profile status

Syntax

show device-profile [config | status]

Description
Displays the device-profile configuration or device-profile status.

Options
config
  Show device profile configuration details for a single profile or all profiles.
status
  Show currently applied device profiles status.
show device-profile config

Syntax

show device-profile config

Description

Shows the device profile configuration.

Command context

config

Examples

Use the command show device-profile config to display the device profile configuration.

switch(config)# show device-profile config

Device Profile Configuration

Configuration for device-profile : default-ap-profile
untagged-vlan : 1
tagged-vlan : None
ingress-bandwidth : 100%
egress-bandwidth : 100%
cos : None
speed-duplex : auto
poe-max-power : Class/LLDP

allow-tunneled-node: Enabled

Device Profile Association
Device Type   : aruba-ap
Profile Name  : default-ap-profile
Device Status : Disabled

Device Type   : aruba-switch
Profile Name  : default-aos-profile
Device Status : Disabled

Device Type   : scs-wan-cpe
Profile Name  : default-scs-profile
Device Status : Disabled

**show device-profile status**

**Syntax**

show device-profile status

**Description**

Shows the profile status of the device.

**Command context**

config

**Example**

Use the **show decive-profile status** command to view status.

```
switch(config)# show device-profile status
Port     Device-type          Applied device profile
-------- -------------------- ----------------------
A1         <device-name>           abc
```

Aruba 2930F / 2930M Management and Configuration Guide
for ArubaOS-Switch 16.07
### Default AP Profile

Creates a user-defined profile.

The profile name is a valid character string with the maximum permissible length of 32. The default profile is named `default-ap-profile` and cannot be modified.

The default configuration parameters may be modified using the command `device-<PROFILE NAME> default-ap-profile`. Up to four different profiles may be configured.

The `[no]` command removes the user-defined profiles.

---

### allow-jumbo-frames

**Syntax**

`allow-jumbo-frames`

**Description**

Configure jumbo frame support for the device port. Jumbo frames are not enabled by default.

**Validation rules**

<table>
<thead>
<tr>
<th>Validation</th>
<th>Error/Warning/Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid jumbo command.</td>
<td>Invalid input.</td>
</tr>
<tr>
<td>If jumbo frame support is configured on a VLAN for which the device profile had overridden the configuration, display the existing warning.</td>
<td>This configuration change will be delayed because a device profile that enables jumbo frame support is applied to a port in this VLAN.</td>
</tr>
</tbody>
</table>

---

### Auto configuring IoT Devices

Wired IoT devices can also be automatically configured using device profiles. Since the market for IoT devices is vast, with several hundred manufacturers and thousands of devices, instead of hardcoding the LLDP signatures, Aruba switches provide a way for an administrator to create a device type for the IoT devices in their deployment. By associating the custom device type that they create with a device profile, users can leverage the power profiles not only for Aruba devices but also for other manufacturers. The requirement for automatic detection of IoT devices is that they should support LLDP.

#### Creating a device identity and associating a device type

**Procedure**

1. Create a device identity using the command:

   ```
   switch# device-identity name <DEVICE-NAME>
   ```

2. Specify the OUI used in LLDP's organization using specific TLV, (type =127). OUI should be in XXXXXX format. The default OUI "000000" indicates that device-identity will not use LLDP to identify device:

   ```
   switch(config)# device-identity name <DEVICE-NAME> lldp oui <MAC_OUI> sub-type <SUBTYPE>
   ```

   To add new device on switch:

   ```
   switch(config)# device-identity name abc lldp oui alb2c3 sub 2
   ```
To remove device from switch:

```
switch(config)# no device-identity name abc
```

3. Show device identity configuration:

```
switch(config)# show device-identity lldp
```

<table>
<thead>
<tr>
<th>Index</th>
<th>Device name</th>
<th>Oui</th>
<th>Subtype</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>abc</td>
<td>a1b2c3</td>
<td>2</td>
</tr>
</tbody>
</table>

**NOTE:** The maximum devices that can be configured using `device-identity` are 16. The maximum devices that can be associated using `device-profile` are 19. The maximum profiles that can be created using `device-profile` are 17.

---

**show device-identity**

**Syntax**

```
show device-identity
```

**Description**

Specify name of the device to be discovered.

**Command context**

`config`

**Usage**

```
device-identity name <device_name> lldp oui <mac_oui> subtype <subtype>
no device-identity name <device_name> lldp oui <mac_oui> subtype <subtype>
```

**Example**

```
device-identity name avayaPhone lldp oui 00096e sub-type 1
```

```
switch(device-profile)# show device-identity

Device Identity Configuration

<table>
<thead>
<tr>
<th>Index</th>
<th>Device name</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>avayaPhone</td>
<td>LLDP</td>
</tr>
</tbody>
</table>
```

```
switch(device-profile)# show device-identity lldp

Device Identity Configuration

<table>
<thead>
<tr>
<th>Index</th>
<th>Device name</th>
<th>Oui</th>
<th>Subtype</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>avayaPhone</td>
<td>00096e</td>
<td>1</td>
</tr>
</tbody>
</table>
**device-profile type-device associate**

From within the configure context:

**Syntax**

```
device-profile type-device <DEVICE_NAME> [associate <PROFILE-NAME> | enable | disable ]
```

**Description**

Specify device name defined in device-identity in order to configure and attach a profile to it. Device identity uses discovery protocol like LLDP to identify device. LLDP makes use of OUI and sub type of organizational specific TLV type 127 to detect device.

**Approved device types**

- **aruba-ap**
  - Aruba access point device.
- **arubaos-switch**
  - ArubaOS switch

**Options**

- `<DEVICE_NAME>`
  - Defines in device-identity.
- `associate <PROFILE-NAME>`
  - Associated the specified device type by profile name.
- `enable`
  - Enables the automatic profile association.
- `disable`
  - Disables the automatic profile association.

**Usage**

Use the following command to configure a device:

```
device-identity name <DEVICE_NAME> lldp oui <OUI> subtype <SUBTYPE>.
```

**Example**

```
device-p device-type avayaPhone associate avaya
```

---

**NOTE:** The device types supported are `aruba-ap` and `arubaos-switch`.

---

**show device-profile config**

**Syntax**

```
show device-profile config
```

**Description**

Shows the device profile configuration.
Command context
config

Examples
Use the command `show device-profile config` to display the device profile configuration.

```
switch(device-profile)# show device-p con avaya
```

<table>
<thead>
<tr>
<th>Device Profile Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration for device-profile : avaya</td>
</tr>
<tr>
<td>untagged-vlan : 1</td>
</tr>
<tr>
<td>tagged-vlan : None</td>
</tr>
<tr>
<td>ingress-bandwidth : 100%</td>
</tr>
<tr>
<td>egress-bandwidth : 100%</td>
</tr>
<tr>
<td>cos : None</td>
</tr>
<tr>
<td>speed-duplex : auto</td>
</tr>
<tr>
<td>poe-max-power : Class/LLDP</td>
</tr>
<tr>
<td>poe-priority : critical</td>
</tr>
<tr>
<td>allow-jumbo-frames : Disabled</td>
</tr>
<tr>
<td>allow-tunneled-node : Enabled</td>
</tr>
</tbody>
</table>

**show device-profile status**

**Syntax**
```
show device-profile [config | status]
```

**Description**
Displays the device-profile configuration or device-profile status.

**Options**
- **config**
  - Show device profile configuration details for a single profile or all profiles.
- **status**
  - Show currently applied device profiles status.

**Switch# show device-profile status**

<table>
<thead>
<tr>
<th>Port</th>
<th>Device-type</th>
<th>Applied device profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>A2</td>
<td>avayaPhone</td>
<td></td>
</tr>
</tbody>
</table>

**Support for Aruba device types**
The following Aruba device types are supported:
- Aruba-AP
- ArubaOS-Switch
- Any device that can be defined using LLDP OUI and subtype in the switch
Isolating Rogue APs

One of the important features to turn on in a mobile-first deployment is the ability of the switches to detect and quarantine rogue access points. Administrators would like to prevent unauthorized access to their networks and a rogue AP can open up the network to unwanted users and traffic.

The Rogue AP Isolation feature detects and blocks any unauthorized APs in the network. You can either log or block the rogue device. If the action requested is to log the rogue device, the MAC address of the rogue device is logged in the system logs (RMON). If the action is to block the rogue device, the traffic to and from the MAC address of the rogue device is blocked. The MAC is also logged in the system log.

When an Aruba AP detects a rogue AP on the network, it sends out the MAC address of the AP as well as the MAC of the clients connected to the AP to the switch using the ArubaOS-Switch proprietary LLDP TLV protocol. The switch then adds a rule in its hardware table to block all the traffic originating from the rogue AP’s MAC address.

The `rogue-ap-isolation` command configures the rogue AP isolation for the switch and gives the option to enable or disable the rogue AP isolation feature. The `rogue-ap-isolation action` command gives you the ability to block the traffic to or from the rogue device or log the MAC of the rogue device. When the action is set to block, the rogue MAC is logged as well. By default, the action is set to block.

The `rogue-ap-isolation whitelist` command lets you add devices detected as possible rogue APs to the whitelist. A maximum of 128 MAC addresses are supported for the whitelist.

The `clear rogue-aps` command clears the detected rogue AP device MAC address.

Using the Rogue AP Isolation feature

Procedure

1. Check the feature state:

```plaintext
switch# show rogue-ap-isolation
Rogue AP Isolation
Rogue AP Status : Disabled
Rogue AP Action : Block
Rogue MAC Address Neighbour MAC Address
----------------- ---------------------
```

2. Enable the feature:

```plaintext
switch# rogue-ap-isolation enable
switch# show rogue-ap-isolation
Rogue AP Isolation
Rogue AP Status : Enabled
Rogue AP Action : Block
Rogue MAC Address Neighbour MAC Address
----------------- ---------------------
```

3. Change the action type from block to log:

```plaintext
switch# rogue-ap-isolation action log
switch# show rogue-ap-isolation
```
Rogue AP Isolation

Rogue AP Status : Enabled
Rogue AP Action : Log

Rogue MAC Address Neighbour MAC Address
----------------- ---------------------

4. List the current whitelist entries:

switch# show rogue-ap-isolation whitelist
Rogue AP Whitelist Configuration

Rogue AP MAC
------------------

5. Add a new whitelist entry:

switch# rogue-ap-isolation whitelist 005056-00326a
switch# show rogue-ap-isolation whitelist
Rogue AP Whitelist Configuration

Rogue AP MAC
------------------
00:50:56:00:32:6a

`rogue-ap-isolation`

**Syntax**

`rogue-ap-isolation {enable | disable}`

**Description**

Configures the rogue AP isolation for the switch.

**Parameters**

- **enable**
  
  Enables the rogue AP isolation.

- **disable**
  
  Disables the rogue AP isolation.

`rogue-ap-isolation action`

**Syntax**

`rogue-ap-isolation action {log | block}`

**Description**

Configures the action to take for the rogue AP packets. This function is disabled by default.

**Parameters**

- **action**
Configure the action to take for rogue AP packets. By default, the rogue AP packets are blocked.

**Options**

log

Logs traffic to or from any rogue access points.

block

Blocks and logs traffic to or from any rogue access points.

**rogue-ap-isolation whitelist**

**syntax**

```
[no] rogue-ap-isolation whitelist <MAC-ADDRESS>
```

**Description**

Configures the rogue AP Whitelist MAC addresses for the switch. Use this command to add to the whitelist the MAC addresses of approved access points or MAC addresses of clients connected to the rogue access points. These approved access points will not be added to the rogue AP list even if they are reported as rogue devices.

**Parameters**

MAC-ADDRESS

Specifies the MAC address of the device to be moved from the rogue AP list to the whitelist.

**Options**

no

Removes the MAC address individually by specifying the MAC.

**Restrictions**

You can add a maximum of 128 MAC addresses to the whitelist.

**clear rogue-ap-isolation**

**syntax**

```
clear rogue-ap-isolation { <MAC-ADDRESS> | all }
```

**Description**

Removes the MAC addresses from the rogue AP list.

**Parameters**

MAC-ADDRESS

Specifies the MAC address of the device to be moved from the rogue AP list.

all

Clears all MAC addresses from the rogue AP list.

**Restrictions**

The MAC addresses cleared using this option will be added back to the rogue list under the following cases:
1. The LLDP administrator status of the port on which the AP that reported the MAC is disabled and enabled back.
2. The data that is in the rogue AP TLV sent from the AP that informed the rogue MAC has changed.
3. To permanently ignore a MAC from being detected as rogue, add it to the whitelist.

**Feature Interactions**

**L3 MAC**

The Rogue AP isolation feature will not block a MAC configured as an IP receive MAC address on a VLAN interface. This event will be logged in RMON if such MACs are detected as rogue.

Conversely, any MAC already blocked by Rogue AP isolation will not be allowed to be configured as an IP receive MAC address of a VLAN interface.

For example:

```
switch# vlan 1 ip-recv-mac-address 247703-3effbb
Cannot add an entry for the MAC address 247703-3effbb because it is already blocked by rogue-ap-isolation.
```

**Limitations**

- You can add a maximum of 128 MAC addresses to the whitelist.
- When a MAC is already authorized by any of the port security features such as LMA, WMA, or 802.1X, the MAC is logged but you cannot block it using the rogue-ap-isolation feature. A RMON event is logged to notify the user.
- When a MAC is already configured as an IP received MAC of a VLAN interface, the MAC is logged but you cannot block it by using the rogue-ap-isolation feature. A RMON event is logged to notify the user.
- When a MAC is already locked out via lockout-mac or locked down using the static-mac configuration, the MAC is logged but you cannot block it using the rogue-ap-isolation feature. A RMON event is logged to notify the user.
- The number of rogue MACs supported on a switch is a function of the value of max-vlans at boot time. Since the resources are shared with the lockout-mac feature, the scale is dependent on how many lockout addresses have been configured on the switch using the lockout-mac feature. The following table lists the scale when there are no lockout addresses configured on the switch:

<table>
<thead>
<tr>
<th>Max VLAN</th>
<th>Supported MACs</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 &lt; VLAN &lt;= 8</td>
<td>200</td>
</tr>
<tr>
<td>8 &lt; VLAN &lt;= 16</td>
<td>100</td>
</tr>
<tr>
<td>16 &lt; VLAN &lt;= 256</td>
<td>64</td>
</tr>
<tr>
<td>256 &lt; VLAN &lt;= 1024</td>
<td>16</td>
</tr>
<tr>
<td>1024 &lt; VLAN &lt;= 2048</td>
<td>8</td>
</tr>
<tr>
<td>2048 &lt; VLAN &lt;= 4094</td>
<td>4</td>
</tr>
</tbody>
</table>
Troubleshooting

Switch does not detect the rogue AP TLVs

Symptom
The switch does not detect the rogue AP TLVs that could be sent from the neighboring device.

Cause
The LLDP administrator status of a port is moved from `txOnly` to `tx_rx` or `rx_only` within 120 seconds of the previous state change to `txOnly`.

Action
1. Wait for 120 seconds before moving from the state `txOnly` to the state `tx_rx` or `rx_only`.
2. Move the administrator status to `disable` and then back to `tx_rx` or `rx_only`.

Show commands
Use the following show commands to view the various configurations and status.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show rogue-ap-isolation</code></td>
<td>Shows the following information:</td>
</tr>
<tr>
<td></td>
<td>• The status of the feature: enabled or disabled.</td>
</tr>
<tr>
<td></td>
<td>• The current action type for the rogue MACs detected.</td>
</tr>
<tr>
<td></td>
<td>• The list of MAC addresses detected as rogue and the MAC address of the AP that reported them.</td>
</tr>
<tr>
<td><code>show rogue-ap-isolation whitelist</code></td>
<td>Shows the rogue AP whitelist configuration.</td>

<td>Cannot add an entry for the MAC address &lt;MAC-ADDRESS&gt; because it is already blocked by rogue-ap-isolation.</td>
</tr>
</tbody>
</table>

## Requirements

Only APs directly connected to the switch will be detected.

## Limitations

- Only one device type is supported, `aruba-ap`, and it is used to identify all the Aruba APs.
- You can modify the configuration parameters of the default profile, `default-ap-profile`, but you cannot delete it or change its name.
- If the port was part of any protocol VLANs prior to the device profile application, those VLANs will not be removed while applying the device profile.
- The `egress-bandwidth` is only supported for devices running on:
  - Aruba 2930F Switch Series
  - Aruba 2930M Switch Series
- Enabling jumbo frame support in a profile affects other ports with different profiles. When a profile has jumbo frames enabled and is applied to any port, all other ports that are members of any VLAN listed in the profile will also have jumbo frame support.

## Feature Interactions

### Profile Manager and 802.1X

Profile Manager interoperates with RADIUS when it is working in the client mode. When a port is blocked due to 802.1X authentication failure, the LLDP packets cannot come in on that port. Therefore, the Aruba AP cannot be detected and the device profile cannot be applied. When the port gets authenticated, the LLDP packets comes in, the AP is detected, and the device profile is applied.

You must ensure that the RADIUS server will not supply additional configuration such as VLAN or CoS during the 802.1X authentication as they will conflict with the configuration applied by the Profile Manager. If the RADIUS server supplies any such configurations to a port, the device profile will not be applied on such ports.

### Profile Manager and LMA/WMA/MAC-AUTH

If either LMA, WMA, or MAC-AUTH is enabled on an interface, all the MAC addresses reaching the port must be authenticated. If LMA, WMA, or MAC-AUTH is configured on an interface, the user can have more granular
control and does not need the device profile configuration. Therefore, the device profile will not be applied on such interface.

**Profile manager and Private VLANs**

When the device profile is applied, a check is performed to verify if the VLAN addition violates any PVLAN requirements. The following PVLAN related checks are done before applying the VLANs configured in the device profile to an interface:

- A port can be a member of only one VLAN from a given PVLAN instance.
- A promiscuous port cannot be a member of a secondary VLAN.

**MAC lockout and lockdown**

The Rogue AP isolation feature uses the MAC lockout feature to block MACs in hardware. Therefore, any MAC blocked with the Rogue AP isolation feature cannot be added with the `lockout-mac` or `static-mac` command if the action type is set to `block`.

For example:

```
switch# lockout-mac 247703-7a8950
Cannot add the entry for the MAC address 247703-7a8950 because it is already blocked by rogue-ap-isolation.
```

```
switch# static-mac 247703-7a8950 vlan 1 interface 1
Cannot add the entry for the MAC address 247703-7a8950 because it is already blocked by rogue-ap-isolation.
```

Similarly, any MAC that was added with the `lockout-mac` or `static-mac` command and that is being detected as rogue will be logged, but not blocked in hardware as it already is set to block. If the MAC is removed from `lockout-mac` or `static-mac` but is still in the rogue device list, it will be blocked back in hardware if the action type is `block`.

**LMA/WMA/802.1X/Port-Security**

Any configuration using LMA, WMA, 802.1X, or Port-Security will not be blocked if the Rogue AP isolation feature is enabled. All these features act only when a packet with the said MAC is received on a port.

If `rogue-ap-isolation` blocks a MAC before it is configured to be authorized, packets from such MACs will be dropped until one of the following happens:

- Rogue action is changed to LOG.
- Rogue-AP isolation feature is disabled.
- The MAC is not detected as rogue anymore.
- LLDP is disabled on the port (or globally).

Once a MAC has been authorized by one of these features, it will not be blocked by Rogue AP isolation. A RMON will be logged to indicate the failure to block.

The Rogue AP module will retry to block any such MACs periodically. In the event of the MAC no longer being authorized, Rogue AP isolation will block the MAC again. No RMON is logged to indicate this event.
Troubleshooting

Dynamic configuration not displayed when using “show running-config”

**Symptom**
The show running-config command does not display the dynamic configuration applied through the device profile.

**Cause**
The show running-config command shows only the permanent user configuration and parameters configured through device profile.

**Action**
Use the specific show device-profile command to display the parameters dynamically configured through the device profile.

The show run command displays non-numerical value for untagged-vlan

**Symptom**
The show run command displays one of the following values for untagged-vlan:

- no untagged-vlan
- untagged-vlan : None

**Cause**
The no device-profile or the no rogue-ap-isolation whitelist command is executed to configure untagged-vlan to 0.

**Action**
No action is required.

**Show commands**
Use the following show commands to view the various configurations and status.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

**NOTE:** The OOBM port is available only on the 2930M Switch Series.

### OOBM concepts

Management communications with a managed switch can be:

- In band—through the networked data ports of the switch
- Out of band—through a dedicated management port (or ports) separate from the data ports

Out-of-band ports have typically been serial console ports using DB-9 or specially wired 8-pin modular (RJ-style) connectors. Some recent switches have added networked OOBM ports.

OOBM operates on a "management plane" that is separate from the "data plane" used by data traffic on the switch and by in-band management traffic. That separation means that OOBM can continue to function even during periods of traffic congestion, equipment malfunction, or attacks on the network. In addition, it can provide improved switch security: a properly configured switch can limit management access to the management port only, preventing malicious attempts to gain access via the data ports.

Network OOBM typically occurs on a management network that connects multiple switches. It has the added advantage that it can be done from a central location and does not require an individual physical cable from the management station to each switch's console port.

### Table 41: Switch management ports

<table>
<thead>
<tr>
<th></th>
<th>In band</th>
<th>Out of band</th>
<th>Networked</th>

<td>1</td>
<td>yes</td>
<td>1</td>
<td>yes</td>
</tr>
<tr>
<td>Ping</td>
<td>yes</td>
<td>yes</td>
<td>yes⁴</td>
<td>yes</td>
</tr>
<tr>
<td>Traceroute</td>
<td>yes⁴</td>
<td>yes</td>
<td>yes⁴</td>
<td>yes</td>
</tr>
</tbody>
</table>

¹ N/A = not applicable
² ***=Ping and Traceroute do not have explicit servers. Ping and Traceroute responses are sent by the host stack.

For applications that have servers, oobm/data/both options have been added to listen mode. There is now a listen keyword in the CLI commands to allow selection of those options. Default value is both for all servers.

**Example**

In a typical data center installation, top-of-rack switches connect servers to the data network, while the management ports of those switches connect to a physically and logically separate management network. This allows network administrators to manage the switches even if operation on the data network is disrupted.
In Figure 111: Network OOBM in a data center on page 715, the switches face the hot aisle of the data center, allowing easy connection to the network ports on the backs of the servers.

For even more control, the serial console ports of the switches can be connected to the management network through a serial console server (essentially, a networked serial switch), allowing the network administrators to view the CLI activity of each switch at boot time and to control the switches through the console ports (as well as through the management ports.)

### OOBM Configuration

OOBM configuration commands can be issued from the global configuration context (config) or from a specific OOBM configuration context (oobm.)

#### Entering the OOBM configuration context from the general configuration context

**Syntax**

    oobm

Enters the OOBM context from the general configuration context.

**Example**

```
switch(config)# oobm
Switch (oobm)#
```

#### Enabling and disabling OOBM

From the OOBM context:

**Syntax**

    enable
disable

From the general configuration context:
Syntax

```
oobm enable oobm disable
```

Enables or disables networked OOBM on the switch.

OOBM is not compatible with either a management VLAN or stacking. If you attempt to enable OOBM when a management VLAN is enabled or when stacking is enabled, the command will be rejected and you will receive an error message.

If an OOBM IP address exists and you disable OOBM, the OOBM IP address configuration is maintained. If you enable OOBM and there is a pre-existing OOBM IP address, it will be reinstated.

Network OOBM is enabled by default.

Examples

```
Switch (oobm)# enable
Switch (oobm)# disable
switch(config)# oobm enable
switch(config)# oobm disable
```

Enabling and disabling the OOBM port

The OOBM interface command enables or disables the OOBM interface (that is, the OOBM port, as opposed to the OOBM function.)

From the OOBM context:

Syntax

```
interface [enable | disable]
```

From the general configuration context:

Syntax

```
oobm interface [enable | disable]
```

Enables or disables the networked OOBM interface (port.)

Examples

```
Switch (oobm)# interface enable
switch(config)# oobm interface disable
```

Setting the OOBM port speed

The OOBM port operates at 10 Mbps or 100 Mbps, half or full duplex. These can be set explicitly or they can be automatically negotiated using the auto setting.

From the OOBM context:

Syntax

```
interface speed-duplex [10-half | 10-full | 100-half | 100-full | auto]
```

From the general configuration context:
Syntax

`oobm interface speed-duplex [10-half | 10-full | 100-half | 100-full | auto]`

Enables or disables the networked OOBM interface (port.) Available settings are:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10-half</td>
<td>10 Mbps, half-duplex</td>
</tr>
<tr>
<td>10-full</td>
<td>10-Mbps, full-duplex</td>
</tr>
<tr>
<td>100-half</td>
<td>100-Mbps, half-duplex</td>
</tr>
<tr>
<td>100-full</td>
<td>100-Mbps, full-duplex</td>
</tr>
<tr>
<td>auto</td>
<td>auto negotiate for speed and duplex</td>
</tr>
</tbody>
</table>

Example

Switch (oobm)# interface speed-duplex auto

Configuring an OOBM IPv4 address

Configuring an IPv4 address for the OOBM interface is similar to VLAN IP address configuration, but it is accomplished within the OOBM context.

From the OOBM context:

Syntax

```
[no] ip address [dhcp-bootp | ip-address/mask-length]
```

From the general configuration context:

Syntax

```
[no] oobm ip address [dhcp-bootp | ip-address/mask-length]
```

Configures an IPv4 address for the switch's OOBM interface.

You can configure an IPv4 address even when global OOBM is disabled; that address will become effective when OOBM is enabled.

Example

Switch (oobm)# ip address 10.1.1.17/24

Configuring an OOBM IPv4 default gateway

Configuring an IPv4 default gateway for the OOBM interface is similar to VLAN default gateway configuration, but it is accomplished within the OOBM context.

From the OOBM context:

Syntax

```
[no] ip default-gateway ip-address
```

From the general configuration context:
Syntax

[no] oobm ip default-gateway ip-address

Configures an IPv4 default gateway for the switch's OOBM interface.

Example

Switch (oobm)# ip default-gateway 10.1.1.1

Configuring an IPv6 default gateway for OOBM devices

An OOBM interface is used for managing devices from remote sites. OOBM devices must be given a default gateway responsible to maintain a network connection when these devices are placed in an IPv6 network enabled with RA suppression.

To configure and enable an IPv6 default gateway for OOBM interfaces, use the `oobm ipv6 default-gateway` command.

`oobm ipv6 default-gateway`

Syntax

`oobm ipv6 default-gateway <IPV6-ADDR>`

no oobm ipv6 default-gateway

Description

Configures the IPv6 default gateway address for OOBM interfaces.

The `no` form of the command deletes the default gateway. It is imperative that an IPv6 address is specified when the `no` form of the command is used.

Command context

config

Parameters

<IPV6-ADDR>

Specifies the IPv6 address when configuring the OOBM for a specific gateway.

Example

switch(config)# oobm ipv6 default-gateway 1001::1/64

`oobm member ipv6 default-gateway`

Syntax

`oobm member <MEMBER-ID> ipv6 default-gateway <IPV6-ADDR>`

no oobm member <MEMBER-ID> ipv6 default-gateway

Description

Configures the IPv6 default gateway address for an OOBM member using their unique identifier and the IPv6 address of the default gateway.
When no proceeds the command, the default gateway address is deleted.

**Command context**

```
config
```

**Parameters**

<MEMBER-ID>

Specifies the unique member-id which allows the OOBM device access to the IPv6 default-gateway.

<IPV6-ADDR>

Specifies the IPv6 address of the default gateway for a member OOBM interface.

**Example**

Configuring and deleting the OOBM member from a specific IPv6 gateway.

```
switch(config)# oobm member 1 ipv6 default-gateway 1001::1
switch(config)# no oobm member 1 ipv6 default-gateway
```

**IPv6 default router preferences**

The command `ipv6 nd ra router-preference {high | medium | low}` provides an extension to the Neighbor Discovery Router Advertisement messages for communicating default router preferences from routers to hosts. The extension improves the ability of hosts to pick the appropriate router for an off-link destination. In network topologies, where the host has multiple routers on its Default Router list, the choice of router for an off-link destination is critical for making the communication more efficient. For example, one router may provide much better performance than another for a destination while choosing a wrong router may result in failure to communicate.

```
ipv6 nd ra router-preference
```

**Syntax**

```
ipv6 nd ra router-preference {low | medium | high}
```

```
no ipv6 nd ra router-preference
```

**Description**

Sets the router-preference configuration for communicating default router preferences from routers to hosts. Improves the ability of hosts to pick the appropriate router for an off-link destination by providing options at the operator level which set the router preference value as low, medium, or high. Depending on the router preference value set, the host receives the value as part of the IPv6 neighbor discovery router advertisement and chooses the best router for communication.

The `no` form of this command removes the router-preference configuration.

**Command context**

```
vlan
```

**Parameters**

```
low
```

Specifies the router-preference value to low.

```
medium
```

Specifies the router-preference value to medium. Medium is the default router-preference value.
Specifies the router-preference value to high.

Usage

- When VRRP is configured, RA messages for Virtual IP are sent with configured router-preference values.
- This command complies with RFC 4191.

Example

Default router-preferences.

```
switch(vlan-1)# ipv6 nd ra router-preference
low                   Set the Default Router Preference to low.
medium                Set the Default Router Preference to medium (default).
high                  Set the Default Router Preference to high.
```

```
switch(vlan-1)# ipv6 nd ra router-preference high
```

**OOBM show commands**

The `show` commands for OOBM are similar to the analogous commands for the data plane. Note that you must always include the `oobm` parameter to see the information for the OOBM interface, regardless of the context. For instance, even from the OOBM context, the `show ip` command displays the IP configuration for the data plane; to see the IP configuration of the OOBM interface, you need to use `show oobm ip`.

**Showing the global OOBM and OOBM port configuration**

Syntax

```
show oobm
```

Summarizes OOBM configuration information. This command displays the global OOBM configuration (enabled or disabled), the OOBM interface status (up or down), and the port status (enabled/disabled, duplex, and speed.)

You can issue this command from any context

**Example**

```
Switch# show oobm

Global Configuration
  OOBM Enabled   : Yes
  OOBM Port Type : 10/100TX
  OOBM Interface Status : Up
  OOBM Port   : Enabled
  OOBM Port Speed : Auto
```

**Showing OOBM IP configuration**

Syntax

```
show oobm ip
```

Summarizes the IP configuration of the OOBM interface. This command displays the status of IPv4 (enabled/disabled), the IPv4 default gateway, and the IPv4 address configured for the interface.
You can issue this command from any context.

**Example**

Switch# show oobm ip

**Showing OOBM ARP information**

**Syntax**

```
show oobm arp
```

Summarizes the ARP table entries for the OOBM interface.

You can issue this command from any context.

**Example**

Switch# show oobm arp

**show oobm ipv6**

**Syntax**

```
show oobm ipv6
```

**Description**

Shows the IPv6 service status for OOBM interfaces.

**Command context**

operator

**Example**

Shows the IPv6 service status for OOBM interfaces.

```
switch# show oobm ipv6
```

**Internet (IPv6) Service for OOBM Interface**

**show oobm ipv6 (for stacked switches)**

**Syntax**

```
show oobm ipv6
```
Description
Shows the OOBM IPv6 interface for a stacked switch.

Command context
operator

Example
Shows the OOBM IPv6 interface for a stacked switch.

```
stack-switch# show oobm ipv6

Internet (IPv6) Service for OOBM Interface

IPv6 Status : Enabled

```

show oobm ipv6 member (for stacked switches)

Syntax

```
show oobm ipv6 member <MEMBER-ID>
```

Description
Shows the OOBM IPv6 service detail for a specific member.

Command context
operator

Example
Shows the OOBM IPv6 service detail for a specific member.

```
stack-switch# show oobm ipv6 member 2

Internet (IPv6) Service for OOBM Interface

IPv6 Status : Enabled
IPv6 Default Gateway : 1000::1

```
Application server commands

Application servers (as described in OOBM and server applications in OOBM concepts on page 713) have added a listen keyword with oobm|data|both options to specify which interfaces are active.

Default value is both for all servers.

Syntax

telnet-server [listen {oobm | data | both}]

Syntax

ip ssh [listen {oobm | data | both}]

Syntax

snmp-server [listen {oobm | data | both}]

Syntax

tftp server [listen {oobm | data | both}]

Syntax

web-management [listen {oobm | data | both}]

In all cases, show running-config displays the server configurations.
Use the no form of the command to prevent the server from running on either interface.

Examples

Telnet: no telnet-server
SSH: no ip ssh ...
SNMP: no snmp-server ...
TFTP: no tftp server
HTTP: no web-management ...

The show servers command shows the listen mode of the servers:

<table>
<thead>
<tr>
<th>Server</th>
<th>Listen mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Telnet</td>
<td>both</td>
</tr>
<tr>
<td>Ssh</td>
<td>both</td>
</tr>
<tr>
<td>Tftp</td>
<td>both</td>
</tr>
<tr>
<td>Web-management</td>
<td>both</td>
</tr>
<tr>
<td>Snmp</td>
<td>both</td>
</tr>
</tbody>
</table>

Application client commands

CLI commands for client applications have added the oobm keyword to allow you to specify that the outgoing request be issued from the OOBM interface. If you do not specify the oobm keyword, the request will be issued from the appropriate in-band data interface. Command syntax is:
Telnet:

telnet ip-address [oobm]

TFTP:

copy tftp ... ip-address filename... [oobm]

SNTP:

[no] sntp server priority priority ip-address [oobm] [version]

TIMEP:

[no] ip timep [dhcp | manual ip-address | [oobm]]

RADIUS:

[no] radius-server host ip-address [oobm]

TACACS+:

[no] tacacs-server host ip-address [oobm]

DNS:

[no] ip dns server-address priority priority ip-address [oobm]

Syslog:

[no] logging ip-address [[control-descri | [oobm]]

Ping:

ping [...] [source [ip-address | vlan-id | oobm]]

Traceroute:

traceroute [...] [source [ip-address|vlan-id|oobm]]

Example

**Figure 112: Example data center** on page 726 shows setup and use of network OOBM using the commands described above.
Assume that the figure below describes how you want to set up your data center.

**Figure 112: Example data center**

Assume that you are configuring the switch in the left-hand rack to communicate on both the data and management networks. You might do the following:

- Configure an IP address on the data network.
- Verify that out-of-band management is enabled. (It is enabled by default.)
- Configure an IP address on the management network.
- Verify that the switch can communicate on both networks.

The CLI commands that follow would accomplish those tasks. (The first time through the process you might easily make the omission shown near the end of the example.)

```
Switch 41# config
Switch 41(config)# vlan 1
Switch 41(vlan-1)# ip address 10.1.129.7/20       Set up IP address on data network.
Switch 41(vlan-1)# end                                  Exit back to manager context.
Switch 41# show oobm                              Look at default OOBM configuration.

Global Configuration
  OOBM Enabled   : Yes
  OOBM Port Type  : 10/100TX
  OOBM Interface Status : Up                              Defaults look appropriate.
  OOBM Port   : Enabled
  OOBM Port Speed  : Auto

Switch 41# config
Switch 41(config)# oobm                                      Go to OOBM context and
Switch 41(oobm)# ip address 10.255.255.41/24                     add IP address and
Switch 41(oobm)# ip default-gateway 10.255.255.1                  default gateway.
Switch 41(oobm)# end                                   Exit back to manager context.
Switch 41# ping 10.1.131.44              Ping server in this rack (on data network.)
  10.1.131.44 is alive, time = 19 ms
Switch 41# ping 10.1.131.51                            Ping server in adjacent rack.
  10.1.131.51 is alive, time = 15 ms
Switch 41# ping 10.255.255.42                          The destination address is unreachable.          Oops! It’s on the management network.
  10.255.255.42 is alive, time = 2 ms
  10.255.255.42 is alive, time = 2 ms
Switch 41# ping source oobm 10.255.255.42             Go through the management port
  10.255.255.42 is alive, time = 2 ms
  10.255.255.42 is alive, time = 2 ms
Switch 41#                                        and it works fine.

Accessing Hewlett Packard Enterprise Support

• For live assistance, go to the Contact Hewlett Packard Enterprise Worldwide website:
  http://www.hpe.com/assistance
• To access documentation and support services, go to the Hewlett Packard Enterprise Support Center website:
  http://www.hpe.com/support/hpesc

Information to collect

• Technical support registration number (if applicable)
• Product name, model or version, and serial number
• Operating system name and version
• Firmware version
• Error messages
• Product-specific reports and logs
• Add-on products or components
• Third-party products or components

Accessing updates

• Some software products provide a mechanism for accessing software updates through the product interface. Review your product documentation to identify the recommended software update method.

• To download product updates:
  Hewlett Packard Enterprise Support Center
  www.hpe.com/support/hpesc
  Hewlett Packard Enterprise Support Center: Software downloads
  www.hpe.com/support/downloads
  Software Depot
  www.hpe.com/support/softwaredepot
• To subscribe to eNewsletters and alerts:
  www.hpe.com/support/e-updates
• To view and update your entitlements, and to link your contracts and warranties with your profile, go to the Hewlett Packard Enterprise Support Center More Information on Access to Support Materials page:
  www.hpe.com/support/AccessToSupportMaterials
IMPORTANT: Access to some updates might require product entitlement when accessed through the Hewlett Packard Enterprise Support Center. You must have an HPE Passport set up with relevant entitlements.

Customer self repair

Hewlett Packard Enterprise customer self repair (CSR) programs allow you to repair your product. If a CSR part needs to be replaced, it will be shipped directly to you so that you can install it at your convenience. Some parts do not qualify for CSR. Your Hewlett Packard Enterprise authorized service provider will determine whether a repair can be accomplished by CSR.

For more information about CSR, contact your local service provider or go to the CSR website:

http://www.hpe.com/support/selfrepair

Remote support

Remote support is available with supported devices as part of your warranty or contractual support agreement. It provides intelligent event diagnosis, and automatic, secure submission of hardware event notifications to Hewlett Packard Enterprise, which will initiate a fast and accurate resolution based on your product’s service level. Hewlett Packard Enterprise strongly recommends that you register your device for remote support.

If your product includes additional remote support details, use search to locate that information.

For Hewlett Packard Enterprise environmental information, including company programs, product recycling, and energy efficiency, see:

www.hpe.com/info/environment

Documentation feedback

Hewlett Packard Enterprise is committed to providing documentation that meets your needs. To help us improve the documentation, send any errors, suggestions, or comments to Documentation Feedback (docsfeedback@hpe.com). When submitting your feedback, include the document title, part number, edition, and publication date located on the front cover of the document. For online help content, include the product name, product version, help edition, and publication date located on the legal notices page.
Overview

Link Aggregation Control Protocol-Multi-Active Detection (LACP-MAD) is a detection mechanism deployed by HPE Comware switches to recover from a breakup of the Intelligent Resilient Framework (IRF) stack due to link or other failure.

LACP-MAD is implemented by sending extended LACP data units (LACPDUs) with a type length value (TLV) that conveys the active ID of an IRF device. The active ID is identical to the member ID of the master and is thus unique to the device. When LACP MAD detection is enabled, the members exchange their active IDs by sending extended LACPDUs.

- When the IRF device operates normally, the active IDs in the extended LACPDUs sent by all members are the same, indicating that there is no multiactive collision.
- When there is a breakup in the IRF chassis, the active IDs in the extended LACPDUs sent by the members in different IRF devices are different, indicating that there are multiactive collisions.

LACP-MAD passthrough helps IRF-capable devices detect multiaccess and take corrective action. These devices do not initiate transmission of LACP-MAD frames or participate in any MAD decision-making process. These devices forward LACP-MAD TLVs received on one interface to the other interfaces on the trunk. LACP-MAD passthrough can be enabled for 24 LACP trunks. By default, LACP-MAD passthrough is disabled.

---

NOTE: This Appendix is applicable only if the customer is using a hybrid deployment of Comware and ArubaOS-Switches.

LACP-MAD Passthrough commands

interface lacp

Syntax

[no] interface <PORT-LIST> lacp [mad-passthrough [enable|disable]|active|passive|key <KEY>]

Description

Defines whether LACP is enabled on a port, and whether it is in active or passive mode when enabled. When LACP is enabled and active, the port sends LACP packets and listens to them. When LACP is enabled and passive, the port sends LACP packets only if it is spoken to.

When LACP is disabled, the port ignores LACP packets. If the command is issued without a mode parameter, 'active' is assumed. During dynamic link aggregation using LACP, ports with the same key are aggregated as a single trunk. MAD passthrough applies only to trunks and not to physical ports.

Parameters

mad-passthrough

Applies only to trunks and not to physical ports.
enable
  Allows the port to send LACP packets.

disable
  When LACP is disabled, the port ignores LACP packets.

active
  When LACP is enabled and active, the port sends LACP packets and listens to them. Defaults to active.

passive
  When LACP is enabled and passive, the port sends LACP packets only if it is spoken to.

key <KEY>
  During dynamic link aggregation using LACP, ports with the same key are aggregated as a single trunk.

show lacp
Syntax
  show lacp [counters | local | peer | distributed | mad-passthrough [counters]]

Description
  Show LACP-MAD passthrough configuration on LACP trunks, or show LACP-MAD passthrough counters on ports.

Parameters
  counters
    Display the various counters related to LACP ports.

  local
    Display the various local information related to LACP ports.

  peer
    Display the LACP peer port information.

  distributed
    Show distributed LACP information.

mad-passthrough
    Display the various counters related to LACP MAD passthrough ports.

Usage
  show lacp mad-passthrough counters [<PORT-LIST>]

clear lacp statistics
Syntax
  clear lacp statistics

Description
  Clear all LACP statistics including MAD passthrough counters. Resets LACP packets sent and received on all ports.
Introduction

TR-069 is a technical specification created by the Broadband Forum. The TR-069 protocol specifies client and server requirements to manage devices across the Internet by using a client server architecture to provide communication between the CPE (Customer Premises Equipment) and the ACS (Auto Configuration Server). A protocol helps to manage complex networks where many devices such as modems, routers, gateways, VoIP phones and mobile tablets compete for resources. TR-069 defines the CPE WAN Management Protocol (CWMP) protocol necessary to remotely manage end-user devices. ACS provides automatic configuration for these devices.

NOTE: CWMP is automatically enabled. To conserve resources, reconfigure this setting using the `cwmp disable` command.

TR-069 defines an auto-configuration architecture which provides the following primary capabilities:

- Auto-configuration and dynamic service provisioning
- Software/firmware image management
- Status and performance monitoring
- Diagnostics
- Bidirectional SOAP/HTTP based protocol
Advantages of TR-069

- TR-069 can manage devices with dynamic IP addresses.
  TR-069 uses Organization Unique ID (OUI) and serial number rather than IP to identify a device.

- TR-069 can manage devices in a private network.
  The HPE ACS BIMS (an iMC module) uses HTTP to communicate with the device, and the session is initiated by the device, so BIMS can pass through NAT to manage the device.

- TR-069 is secure.
  TR-069 can use HTTPS to communicate with or transfer files to/from the device; it is more secure than TFTP, FTP or Telnet.

- TR-069 is suitable for WAN management across internet.

- TR-069 is suitable for zero-touch configuration.
  The zero-configuration mechanism is defined in the TR-069 specification.

- TR-069 is suitable for large-scale device management.
  TR-069 supports distributed architecture. The ACS can be distributed to multiple servers, each ACS can manage part of devices.

Zero-touch configuration process

Auto configuration or “zero-touch” deployment is a recurring customer requirement, especially for remote-office deployments. New devices introduced inside a private network require management tools to be co-located to configure them or update firmware, or require manual intervention to do configuration. TR-069 allows managing...
devices that reside in a private network via HTTP(S), enabling a new set of deployment and management models today, not possible using SNMP.

The client side, when configured, will contact the server at a predefined URL, using HTTP or HTTPS as protocol. After authentication, the ACS is able to perform the following basic operations:

- Update CPE Configuration.
- Update CPE TR-069 parameters.
- Update CPE firmware.
- Reboot CPE (backup, startup, and running configurations)
- Run CPE ping diagnostics.
- Reset CPE to factory default.
- Get periodic Status (several parameters can be retrieved depending on what is supported).

Since TR-069 uses HTTP, it can be used across a WAN. If the CPE can reach the URL, it can be managed. TR-069 is mostly a push protocol where the client periodically sends information without server requests. This allows for greater scalability over traditional SNMP based tools, which are also bounded to work within the LAN, while TR-069 can offer management to remote offices.
Zero-touch configuration for Campus networks

In this example, the following steps to configure CPEs for a Campus Network environment.

1. Pre-configuration for all CPEs in BIMS.
2. CPEs get BIMS parameters from DHCP server.
3. CPEs initiate a connection to BIMS, then BIMS deploys the pre-configuration to CPEs.

Zero-touch configuration for Branch networks

In this example, the following steps to configure CPEs for a Branch network environment.
1. Create the basic configuration for your spoke device manually, using the username/password from ISP and BIMS URL.
2. The IPSec VPN configuration is generated by IVM and deployed by BIMS.
3. The IPSec VPN tunnel is automatically created.
4. The device in the branch private network can DHCP relay to HQ to continue the zero touch configuration.

Zero-touch configuration setup and execution

1. DHCP configuration
2. BIMS configuration
3. Execution

**CLI commands**
**Configuration setup**

Within the configure mode:

**Syntax:**

```
cwmp
acs
  Configure Auto Configuration Server (ACS) access.
cpe
  Configure Customer Premises Equipment (CPE) access.
disable
  Disable the CPE WAN Management Protocol.
enable
  Enable the CPE WAN Management Protocol.
```

**NOTE:**

CWMP is automatically enabled. To conserve resources, reconfigure this setting using the `cwmp disable` command.

```
[cno] cwmp
acs
  Configure Auto Configuration Server (ACS) access.
cpe
  Configure Customer Premises Equipment (CPE) access.
enable
  Enable the CPE WAN Management Protocol.
```

**ACS password configuration**

**Syntax:**

```
cwmp acs
password
  Configure the password used for authentication when the switch connects to the ACS.
url
  Configure the URL of the ACS.
username
  Configure the username used for authentication when the switch connects to the ACS.
```
When encrypt-credentials is off
Syntax:

cwmp acs password plaintext

Configure the password used for authentication when the switch connects to the ACS.

When encrypt-credentials is on
Syntax:

cwmp acs password encrypted-key

An encrypted password generated with the encrypt-credentials command.
plaintext

Configure the password used for authentication when the switch connects to the ACS.

Encrypt-credential on

cwmp acs password encrypted-key

ASCII-STR

Enter an ASCII string (maximum length: 384 characters).

Plaintext password

cwmp acs password plaintext

PASSWORD-STR

A plaintext password used for ACS authentication (maximum length: 256 characters).

ACS URL configuration
Syntax:

cwmp acs url

URL-STR

The URL of the ACS (maximum length: 256 characters).

ACS username configuration
Syntax:

cwmp acs username

USERNAME-STR

A username for ACS authentication (maximum length: 256 characters).
CPE configuration
Syntax:

```
cwmp cpe password
```
Configure the password used for authentication when the ACS connects to the switch.

```
cwmp cpe
username
```
Configure the username used for authentication when the ACS connects to the switch.

CPE password configuration

When encrypt-credentials is on
Syntax:

```
cwmp cpe password encrypted-key
```
An encrypted password generated with the 'encrypt-credentials' command.

```
cwmp cpe password plaintext
```
Configure the password used for authentication when the ACS connects to the switch.

Syntax:

```
cwmp cpe password encrypted-key
```
ASCII-STR
Enter an ASCII string (maximum length: 384 characters).

When encrypt-credentials is off
Syntax:

```
cwmp cpe [password]
```
plaintext
Configure the password used for authentication when the ACS connects to the switch

Syntax:

```
cwmp cpe [password]
```
plaintext
A plaintext password used for ACS authentication (maximum length: 256 characters).

CPE username configuration
Syntax:

```
cwmp cpe [username]
```
USERNAME-STR

A username for ACS authentication (maximum length: 256 characters).

Enable/disable CWMP
Syntax:

cwmp [enable|disable]

Show commands

CWMP configuration and status query
Syntax:

show cwmp
configuration
  Show current CWMP configuration.
status
  Show current CWMP status.

When CWMP is enabled
Syntax:

show cwmp configuration

---

**CWMP configuration**

<table>
<thead>

<td>Wed Apr 9 16:56:00 2014</td>
</tr>
<tr>
<td>Time to Next Connection</td>
<td>00:00:36</td>
</tr>
</tbody>
</table>
When CWMP is disabled

Syntax:

```
show cwmp status
```

**CWMP status**

<table>
<thead>
<tr>
<th>CWMP Status</th>
<th>: Disabled</th>
</tr>
</thead>
</table>

**CWMP configuration**

```
show cwmp configuration
```

<table>
<thead>
<tr>
<th>CWMP Configuration</th>
<th>: Disabled</th>
</tr>
</thead>
</table>

**Event logging**

The TR-069 client offers some tools to diagnose problems:

- System logging
- Status/control commands

**System logging**

The CPE implements the following system log notification codes and sample messages:

- **RMON_TR69_INFORM_COMPLETE**
  - INFORM to http://15.29.20.50:9090/ from (IP address not set yet) completed with error.
  - INFORM to http://15.29.20.50:9090/ from 10.0.10.212 completed with error.
  - INFORM to http://15.29.20.50:9090/ from 10.0.10.212 completed successfully.

- **RMON_TR69_AUTH_FAILED**

- **RMON_TR69_CONN_FAILED**
  - Connection attempts with ACS http://15.29.20.50:9090/ from 10.0.10.212 failed.

To avoid flooding the system log on frequent attempts to connect with the ACS, the following criteria are used with both successful and failed attempts:

1. The very first event is always logged.
2. Any change from success to failure or vice versa is always logged.
3. Repeat success or failure events are logged only once every five minutes.

The HTTP file transfer component supports these system log notification codes and sample messages:
• **RMON_HTTP_XFER_COMPLETE**

• **RMON_HTTP_CONN_FAILED**

• **RMON_HTTP_TIMED_OUT**
  ◦ W 02/20/14 00:32:17 04192 http: Upload of SourceFile to http://10.0.11.240:9876/path timed out.

• **RMON_HTTP_NO_SPACE**

• **RMON_HTTP_REQ_FAILED**

• **RMON_HTTP_WRONG_FILE**

## Limitations

Switch configuration restore without reboot feature does not support the following scenarios:

- Removing a physically present member through `cfg-restore` command
- Flex-module provisioning or removal on standalone or a stack
- Module provisioning or removal on standalone or a stack
- Adding a VLAN when the VLAN limit is already reached by having dynamic VLANs. Due to timing issues, ports or dynamic VLANs take some time to become offline or be removed, even after applying a removal command. In such a case, restore commands fail as normal CLI commands.
- The maximum number of backup configuration files has been increased from three to five. When the firmware is downgraded to lower versions, the `show config files` command displays the details to only three configuration files.
- Restore is allowed based on the available system resource factors.

## Blocking of configuration from other sessions

All `write` operations are not allowed from other sessions (CLI/WebUI/SNMP/REST, and so on) during a configuration restoration process. Only `read` operation is allowed. Attempts to use `write` operation results in the configuration restore is in progress, configuration changes are temporarily disabled error. The following `show` commands are blocked during a configuration restoration process:

- `show-tech`
- `show config`
- `show running-config`
- `show startup-config`
Smart Rate is a new technology designed to enable higher port link speeds on legacy cabling where an Ethernet RJ45 port type can link at 1Gbps, 2.5Gbps, 5Gbps, or 10Gbps.

When situations occur where a network link establishes at a lower than expected speed (or not at all) due to marginal or bad cabling, the Smart Rate port technology allows administrators to triage cabling issues and determine root causes of lower than expected performance.

Smart Rate Technology is available on the following products:

Switch 5400R v3 zl2 modules (J9991A, J9995A)
Switch 5400R chassis switch bundles (JL002A)

**Show Smart Rate port**

**Syntax**

`show interface PORT-LIST smartrate`

Displays port diagnostics on a Smart Rate port.

### Unlinked Smart Rate port

```
show interface C5 smartrate
```

**Status and Counters - Smart Rate information for Port C5**

Rate-Limiting — GMB features when Fast-Connect SmartRate ports are configured

When Rate-Limiting or Guaranteed Minimum Bandwidths are configured for 5Gbps ports, the granularity of percentage-based rates for the 5Gbps speed is in steps of 2%. For example, a 1% rate-limit for a 5Gbps port will function as a 2% limit while a 5% limit will function as a 6% limit.

The Guaranteed Minimum Bandwidth profiles will show the same behavior. For example on an 8-queue system, the actual default servicing profile will be 2%, 4%, 30%, 10%, 10%, 10%, 16%, and 20%. The CLI and SNMP...
values for these ports will show what the customer configured, but the actual hardware results will be in steps of 2%.

This limitation only applies to 5Gbps ports. Ports running at 2.5Gbps have the same 1% granularity as all previously-offered port speeds.

**Error messages**

When the `show interface PORT-LIST smartrate` command is run on a non-Smart Rate port, the command will fail with an error message similar to the following: Port A1: This command is only applicable to Smart Rate ports.

When the `show interface PORT-LIST smartrate` command is run on a Smart Rate port, but is unable to retrieve all results the command will fail with an error message similar to the following: Port A1: This command did not complete successfully. Please try again.

**Speed-duplex**

**Syntax**

`interface PORT-LIST speed-duplex`

**Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Auto-negotiate link parameters.</td>
</tr>
<tr>
<td>auto-100</td>
<td>100 Mbps only, auto-negotiate link parameters.</td>
</tr>
<tr>
<td>auto-1000</td>
<td>1000 Mbps only, auto-negotiate link parameters.</td>
</tr>
<tr>
<td>auto-2500</td>
<td>2500 Mbps only, auto-negotiate link parameters.</td>
</tr>
<tr>
<td>auto-5000</td>
<td>5000 Mbps only, auto-negotiate link parameters.</td>
</tr>
<tr>
<td>auto-2500-5000</td>
<td>2500 or 5000 Mbps only, auto-negotiate link parameters.</td>
</tr>
<tr>
<td>auto-10g</td>
<td>10 Gbps only, auto-negotiate link parameters.</td>
</tr>
</tbody>
</table>

**Limitations on 5Gbps ports**

For 5Gbps ports, when the customer has Rate-Limiting or Guaranteed Minimum Bandwidths configured, the granularity of percentage-based rates for the 5Gbps speed is in steps of 2%. For example a 1% rate-limit for a 5Gbps port will function as a 2% limit, a 5% limit will function as a 6% limit. The Guaranteed Minimum Bandwidth profiles will show the same behavior. On an 8-queue system, the actual default servicing profile will be 2% 4% 30% 10% 10% 10% 10% 16% 20%. The CLI and SNMP values for these ports will show what the customer configured, but the actual hardware results will be in steps of 2%.

---

**NOTE:**

This limitation only applies to the 5Gbps ports. Ports running at 2.5Gbps have a 1% granularity in port speeds.
Error messages

- On ports that do not support the respective speed-duplex option, the command will fail with an error message similar to the following:
  
  Value auto-10 is not applicable to port E1.

- The following speed-duplex options are not available on switch platforms that do not have Smart Rate ports.
  - auto-2500
  - auto-5000
  - auto-2500-5000

100 Mbps Support on Smart Rate ports

Overview

Smart Rate ports are designed to link devices at 1 Gbps, 2.5 Gbps, 5 Gbps, and 10 Gbps. Older devices such as legacy printers can run at maximum speed of 100 Mbps. To address this issue, the speed duplex auto-100 enhancement is introduced on Smart-Rate ports. Depending on the device model, Smart Rate ports can operate on 100Mbps speed.

**NOTE:** If MACsec is configured on a port, we cannot configure speed duplex as auto-100 for that particular port, and conversely.

100Mbps is supported on auto speed duplex mode by default.

100 Mbps support on Smart Rate ports is available for 5400R, 3810M and 2930M.

interface speed-duplex auto-100

Syntax

```
interface <PORT> speed-duplex auto-100
```

Description

Configures speed option to support Auto-100 on Smart Rate ports.

Command context

```
config
```

Parameter

**PORT**

Specify a port number.

Example

```
switch(config)#interface A1 speed-duplex auto-100
switch(config)#show interface brief
Status and Counters - Port Status
<table>

<td>Auto off 0</td>
</tr>
</tbody>
</table>
```
show interfaces smartrate

Syntax

show interfaces <PORT-LIST> smartrate

Description

Displays Smart Rate diagnostic information.

Parameter

PORT-LIST

Specify a port number or a list of ports.

Examples

switch(config)# show interfaces A1 smartrate

Status and Counters – Smart Rate information for Port A1

Model : 0x03a1
Chip : 0xb582
Firmware : 3.3.e
Provisioning : 0x0002

Established link speed : 100BASE-T
Number of attempts to establish link : 1
Uptime since link was established : 30 seconds

Local Port advertised capabilities
100MBT | 1.0GBT | 2.5G NBT | 5.0G NBT | 2.5GBT | 5.0GBT | 10GBT

Yes | Yes | Yes | Yes | Yes | Yes | Yes

Link Partner advertised capabilities
### show interface config

**Syntax**

```
show interface config
```

**Description**

Displays port settings.

**Example**

```
switch#(config) show interface config
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Enabled Mode</th>
<th>Flow Ctrl</th>
<th>MDI</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>10GbE-T</td>
<td>Yes</td>
<td>Auto-100</td>
<td>Disable</td>
</tr>
<tr>
<td>A2</td>
<td>10GbE-T</td>
<td>Yes</td>
<td>Auto</td>
<td>Disable</td>
</tr>
<tr>
<td>A3</td>
<td>10GbE-T</td>
<td>Yes</td>
<td>Auto</td>
<td>Disable</td>
</tr>
<tr>
<td>A4</td>
<td>10GbE-T</td>
<td>Yes</td>
<td>Auto</td>
<td>Disable</td>
</tr>
</tbody>
</table>

### show running-config

**Syntax**

```
show running-config
```

**Description**

The Smart Rate port auto-100 is part of the `show running config` output.

**Example**

```
switch(config)# show running-config
```

Running configuration:

```
; JL320A Configuration Editor; Created on release WC.16.06.0000x
; Ver #13:03.f8.1c.9b.3f.bb.ef.7c.59.fc.6b.fb.9f.fc.ff.37.ef:49

module 1 type j1320a
flexible-module A type JL081A
interface A1
  speed-duplex auto-100
exit
```

### Downgrade with CLI reboot command

**Procedure**

1. If the Smart Rate port speed configuration is `auto-100`, the `boot system flash primary` command will prompt user to change the `auto-100` to other configuration.

```
switch# boot system flash primary
```

This will reboot the system from the primary image.
Continue (y/n)? y

2. To proceed, select y.

Firmware downgrade is not allowed when smartrate port is configured with auto-100. Please change the speed-duplex to other configuration.

3. To reject, select n.

**Downgrade without CLI reboot command (power cycle)**

**Procedure**

1. **Reboot** with auto-100 mode configuration on Smart Rate port, the following events occur:
   
   a. The speed duplex status is shown blank when you execute the `show interface brief` command.
   b. The port status is displayed as down.

2. Save the configuration and again **reboot**. The preconfigured auto-100 restores the Smart Rate port to auto mode, thus restoring its functionality.
