THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: The equipment described in this manual generates and may radiate radio-frequency energy. If it is not installed in accordance with Cisco’s installation instructions, it may cause interference with radio and television reception. This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in part 15 of the FCC rules. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

Modifying the equipment without Cisco’s written authorization may result in the equipment no longer complying with FCC requirements for Class A or Class B digital devices. In that event, your right to use the equipment may be limited by FCC regulations, and you may be required to correct any interference to radio or television communications at your own expense.

You can determine whether your equipment is causing interference by turning it off. If the interference stops, it was probably caused by the Cisco equipment or one of its peripheral devices. If the equipment causes interference to radio or television reception, try to correct the interference by using one or more of the following measures:

• Turn the television or radio antenna until the interference stops.
• Move the equipment to one side or the other of the television or radio.
• Move the equipment farther away from the television or radio.
• Plug the equipment into an outlet that is on a different circuit from the television or radio. (That is, make certain the equipment and the television or radio are on circuits controlled by different circuit breakers or fuses.)

Modifications to this product not authorized by Cisco Systems, Inc. could void the FCC approval and negate your authority to operate the product.

Product Overview

This chapter describes the Nexus 5000 series switches and contains these sections:

- Nexus 5020 Switch, page 1-1
- Nexus 5010 Switch, page 1-15

Nexus 5020 Switch

This section describes the Cisco Nexus 5020 switch and its components. This section includes the following topics:

- Features, page 1-1
- Chassis, page 1-2
- Ports, page 1-8
- Expansion Modules, page 1-5
- Power Supply, page 1-9
- Fan Module, page 1-10

Features

The Cisco Nexus 5020 switch is a 2 RU, top-of-rack switch that provides Ethernet and Fibre Channel consolidation in a single physical cable. The Fibre Channel over Ethernet (FCoE) protocol is used to consolidate Ethernet and Fibre Channel traffic onto the same physical connection between the server and the switch. As a top-of-rack switch, all the servers in the rack connect to the Cisco Nexus 5020 switch, and it connects to the LAN or SAN.

The Cisco Nexus 5020 switch is a part of a family of switches that provide 10-Gigabit Ethernet and FCoE ports and both 10-Gigabit Ethernet and native 1-, 2-, and 4-Gbps Fibre Channel ports. The switches provide consolidated I/O connectivity to both production Ethernet LANs and Fibre Channel SANs in a cost-effective, high-performance, low-latency Ethernet switch.

The Cisco Nexus 5020 switch has the following features:

- Forty fixed 10-Gigabit Ethernet server connection ports on the back of the switch
Two slots for optional 10-Gigabit expansion modules or Fibre Channel interfaces on the back of the switch

Two slots on the front of the switch for hot swap-capable power supplies

Five slots on the front of the switch for hot swap-capable fan modules, each of which houses two fans, that provide front-to-back cooling for the switch

Chassis

The Cisco Nexus 5020 chassis is 2 RU (3.47 inches) tall, 17.3 inches wide, and 30.0 inches deep. It is designed to be mounted in a standard 19-inch rack. The switch has two power supplies and five fans modules on the front of the switch. Ports are at the rear of the switch. The airflow is front to back. Figure 1-1 shows the front of the Cisco Nexus 5020 switch.

Figure 1-2 shows a close-up view of the front of the switch.
The rear of the Cisco Nexus 5020 chassis has 40 fixed 10-Gigabit Ethernet ports, 2 slots for optional expansion modules, an Ethernet connector with 2 cross-connect ports and 2 management ports, a console port, and 2 AC power connectors. Figure 1-3 shows the rear of the Cisco Nexus 5020 switch.
Figure 1-4 shows a close-up view of the rear of the Cisco Nexus 5020 chassis.

Expansion Modules

Expansion modules allow Cisco Nexus 5000 switches to be configured as cost-effective 10-Gigabit Ethernet switches and as I/O consolidation platforms with native Fibre Channel connectivity. The Cisco Nexus 5020 switch has two slots that can be used for the following optional expansion modules:

- Fibre Channel plus Ethernet expansion module with four 10-Gigabit Ethernet Cisco Data Center Ethernet and FCoE ports and four 1-, 2-, and 4-Gbps Fibre Channel ports
- Ethernet expansion module with six ports of 10-Gigabit Ethernet Cisco Data Center Ethernet and FCoE

The chassis supports hot swapping of the expansion modules.

Fibre Channel Plus Ethernet Expansion Module

The Fibre Channel plus Ethernet expansion module supports four SFP+ transceiver modules and four 1-, 2-, 4-Gbps Fibre Channel transceivers. The Fibre Channel plus Ethernet expansion module is a field-replaceable unit (FRU). Figure 1-6 shows the Fibre Channel plus Ethernet expansion module.

Figure 1-7 shows the front of the Fibre Channel plus Ethernet expansion module. Figure 1-11 shows how ports are numbered on the Fibre Channel plus Ethernet expansion module.
Ethernet Expansion Module

The Ethernet expansion module supports six 10-Gigabit Ethernet ports, four of which will have encryption capability. The Ethernet expansion is a field-replaceable unit (FRU). Figure 1-8 shows the Ethernet expansion module.

Ports

Each individual port on the Cisco Nexus 5020 switch is numbered, and groups of ports are numbered based on their function. The ports are numbered top to bottom and left to right. The 40 fixed ports form group 1 and are named 1/port_number. Ports 1 through 32 are unencrypted Ethernet ports. Of these, ports 1 through 16 are 10-Gigabit Ethernet and 1-Gigabit Ethernet capable ports. Ports 33 through 40 are encryption-capable Ethernet ports.

Group 2 includes the ports in the top-most expansion module. Group 2 ports 1 through 4 are encrypted Ethernet ports. Group 2 ports 5 through 8 are Fibre Channel ports.

Group 3 includes the ports in the bottom-most expansion module. Group 3 ports 1 through 4 are encrypted Ethernet ports. Group 3 ports 5 through 8 are Fibre Channel ports.

Figure 1-11 shows how ports are numbered and grouped by function for both the fixed ports and the Fibre Channel plus Ethernet expansion module ports.

C  Group 1/ports 33 through 40: Encrypted Ethernet ports
D  Groups 2 and 3/ports 1 through 4: Encrypted Ethernet ports
E  Groups 2 and 3/ports 5 through 8: Fibre Channel ports

Figure 1-12 shows how ports are numbered and grouped by function for both the fixed ports and the Ethernet expansion module ports.
Power Supply

The Cisco Nexus 5020 switch uses a front-end power supply. The chassis has slots for two power supplies. Two power supplies can be used for redundancy, but the Cisco Nexus 5020 switch is fully functional with one power supply. Figure 1-13 shows the power supply, which has two LEDs: one for power status and one for failure condition.
Table 1-2 table describes the status of the two power supply LEDs.

Chapter 1  Product Overview

Features

The Cisco Nexus 5010 switch is a 1RU, top-of-rack switch that provides Ethernet and Fibre Channel consolidation in a single physical cable. The Fibre Channel over Ethernet (FCoE) protocol is used to consolidate Ethernet and Fibre Channel traffic onto the same physical connection between the server and the switch. As a top-of-rack switch, all the servers in the rack connect to the Cisco Nexus 5010 switch, and it connects to the LAN or SAN.

The Cisco Nexus 5010 switch is a part of a family of switches that provide 10-Gigabit Ethernet and FCoE ports and both 10-Gigabit Ethernet and native 1-, 2-, and 4-Gbps Fibre Channel ports. The switches provide consolidated I/O connectivity to both production Ethernet LANs and Fibre Channel SANs in a cost-effective, high-performance, low-latency Ethernet switch.

The Cisco Nexus 5010 switch has the following features:

- One slot on the back of the switch for an optional uplink Gatos Expansion Module [GEM]. There are several modules which can be accommodated in this slot. Three such modules are N5K-M1404, N5K-M1600 and N5K-M1008.
Twenty to twenty-eight ports on the back of the switch depending on which GEM is installed. This is because twenty ports on Cisco Nexus 5010 switch belong to the base switch. Additionally, one module can be inserted which can be of 6 or 8 ports.

- Two slots on the front of the switch for hot swap-capable power supplies.
- Two slots on the front of the switch for fan modules. Each fan module houses six fans. The combination of six fans per module and two modules provides the switch with a total of 12-fans.

**Chassis**

The Cisco Nexus 5010 chassis is 1 RU, 1.72 inches tall, 17.3 inches wide and 30.0 inches deep. It is designed to be mounted in a standard 19-inch rack. The switch has two power supplies and two fans modules on the front of the switch. Ports are at the rear of the switch. The airflow is front to back. Figure 1-17 shows the front of the Cisco Nexus 5010 switch.

**Expansion Modules**

Expansion modules allow Cisco Nexus 5000 switches to be configured as cost-effective 10-Gigabit Ethernet switches and as I/O consolidation platforms with native Fibre Channel connectivity. The Cisco Nexus 5010 switch has one slot for an optional uplink Gatos Expansion Module (GEM). There are several modules which can be accommodated in this slot. Three such modules are N5K-M1404, N5K-M1600 and N5K-M1008.

- N5K-M1404 provides 4 10G SFP+, and 4 Fiber Channel 1/2/4G SFP based uplink connections. The 10GE ports are encryption capable.
- M5K-M1600 provides 6 10G SFP+ based uplink connections.
- N5K-M1008 provides 8 1/2/4G Fiber Channel, SFP based uplink connection.

The chassis supports hot swapping of the expansion modules.

**N5K-M1404**

The N5K-M1404 GEM supports four SFP+ transceiver modules and four 1-, 2-, 4-Gbps Fibre Channel transceivers. The Fibre Channel plus Ethernet expansion module is a field-replaceable unit (FRU). Figure 1-22 shows the Fibre Channel plus Ethernet expansion module.

Ports

Each individual port on the Cisco Nexus 5010 switch is numbered, and groups of ports are numbered based on their function. The ports are numbered top to bottom and left to right.

There are 20-28 ports on the Cisco Nexus 5010 switch, depending on which GEM is installed.

The 20 fixed ports form group 1 and are named /port_number. Ports 1 through 16 are unencrypted Ethernet ports. Of these, ports 1 through 8 are 10-Gigabit Ethernet and 1-Gigabit Ethernet capable ports. Ports 17 through 20 are encryption-capable Ethernet ports.

Group 2 includes the ports in the GEM module. Group 2 ports 1 through 4 are encrypted Ethernet ports. Group 2 ports 5 through 8 are Fibre Channel ports.

Figure 1-27 shows how ports are numbered and grouped by function with the N5K-M1404 GEM installed.

Preparing for Installation

This section includes the following topics:

- Installation Options, page 2-2
- Installation Guidelines, page 2-3
- Required Equipment, page 2-4
- Unpacking and Inspecting the Switch, page 2-4

Installation Options

The Cisco Nexus 5000 switch can be installed using the following methods:

- In an open EIA rack, using the following items:
  - The rack-mount kit shipped with the switch
  - The EIA Shelf Bracket Kit (an optional kit, purchased separately)
- In a perforated or solid-walled EIA cabinet, using:
  - The rack-mount kit shipped with the switch
  - The EIA Shelf Bracket Kit (an optional kit, purchased separately)

For instructions on installing the switch using the rack-mount kit shipped with the switch, see the “Installing the Cisco Nexus 5020 Chassis in a Cabinet or Rack” section on page 2-5.

Airflow Considerations

Airflow through the Cisco Nexus 5000 switch is from front to back. Air enters the chassis through the fan trays and power supplies mounted at the front of the chassis and exits the chassis through perforations on the rear of the chassis. To ensure proper airflow, follow these guidelines:

- Maintain ambient airflow throughout the data center to ensure normal operation.
- Consider the heat dissipation of all equipment when determining air-conditioning requirements. When evaluating airflow requirements, take into consideration that hot air generated by equipment at the bottom of the rack can be drawn in the intake ports of the equipment above.

Chassis Weight

When lifting the system, follow these guidelines:
Disconnect all power and external cables before lifting the system.

Have two people to lift the system. The Nexus 5020 weighs 50 lb (22.680 kg) and the Nexus 5010 weighs 35 lb.

Ensure that your footing is solid and the weight of the system is evenly distributed between your feet.

Lift the system slowly, keeping your back straight. Lift with your legs, not with your back. Bend at the knees, not at the waist.

Installation Guidelines

When installing the Cisco Nexus 5000 switch, follow these guidelines:

- Plan your site configuration and prepare the site before installing the chassis. Appendix D, “Site Planning and Maintenance Records,” lists the recommended site planning tasks.

- Record the information listed in Appendix D, “Site Planning and Maintenance Records,” as you install and configure the switch.

- Ensure that there is adequate space around the switch to allow for servicing the switch and for adequate airflow (Appendix B, “Technical Specifications,” lists airflow requirements).

- Ensure that the air-conditioning meets the heat dissipation requirements listed in Appendix B, “Technical Specifications.”

- Ensure that the cabinet or rack meets the requirements listed in Appendix A, “Cabinet and Rack Installation.”

Note: Jumper power cords are available for use in a cabinet. See the “Jumper Power Cord” section on page C-10.

- Ensure that the chassis is adequately grounded. If the switch is not mounted in a grounded rack, we recommend connecting both the system ground on the chassis and the power supply ground to an earth ground.

- Ensure that the site power meets the power requirements listed in Appendix B, “Technical Specifications.” If available, you can use an uninterruptible power supply (UPS) to protect against power failures.

Caution: Avoid UPS types that use ferroresonant technology. These UPS types can become unstable with systems such as the Cisco Nexus 5000 switch, which can have substantial current draw fluctuations because of fluctuating data traffic patterns.

- Ensure that circuits are sized according to local and national codes. For North America, the power supply requires a 15-A or 20-A circuit.

Caution: To prevent loss of input power, ensure the total maximum loads on the circuits supplying power to the switch are within the current ratings for the wiring and breakers.
Preparing for Installation

Send documentation comments to nexus5kdocs@cisco.com

- Use the following screw torques when installing the switch:
  - Captive screws: 4 in-lb
  - M3 screws: 4 in-lb
  - M4 screws: 12 in-lb
  - 10-32 screws: 20 in-lb
  - 12-24 screws: 30 in-lb

Required Equipment

Before beginning the installation, ensure that the following items are ready:
- Number 1 and number 2 Phillips screwdrivers with torque capability
- 3/16-in. flat-blade screwdriver
- Tape measure and level
- ESD wrist strap or other grounding device
- Antistatic mat or antistatic foam

The following additional items (not found in the accessory kit) are required to ground the chassis:
- Grounding cable (6 AWG recommended), sized according to local and national installation requirements; the required length depends on the proximity of the Cisco Nexus 5000 switch to proper grounding facilities
- Crimping tool large enough to accommodate girth of lug
- Wire-stripping tool

Unpacking and Inspecting the Switch

Caution
When handling switch components, wear an ESD strap and handle modules by the carrier edges only. An ESD socket is provided on the chassis. For the ESD socket to be effective, the chassis must be grounded through the power cable, the chassis ground, or the metal-to-metal contact with a grounded rack.

Tip
Keep the shipping container in case the chassis requires shipping in the future.

Note
The switch is thoroughly inspected before shipment. If any damage occurred during transportation or any items are missing, contact your customer service representative immediately.

To inspect the shipment, follow these steps:

Step 1
Compare the shipment to the equipment list provided by your customer service representative and verify that you have received all items, including the following:
- Print documentation
Step 2

Check for damage and report any discrepancies or damage to your customer service representative. Have the following information ready:

- Invoice number of shipper (see packing slip)
- Model and serial number of the damaged unit
- Description of damage
- Effect of damage on the installation

   a. Insert two screws (12-24 or 10-32, depending on rack type) through the cage nuts and the holes in one of the front rack-mount brackets and into the threaded holes in the rack-mounting rail. This procedure is the same as that for the Cisco Nexus 5020 switch. See Figure 2-4.
   b. Repeat for the front rack-mount bracket on the other side of the switch.

Grounding the System

This section describes the need for system grounding and explains how to prevent damage from electrostatic discharge.

Proper Grounding Practices

Grounding is one of the most important parts of equipment installation. Proper grounding practices ensure that the buildings and the installed equipment within them have low-impedance connections and low-voltage differentials between chassis. When you properly ground systems during installation, you reduce or prevent shock hazards, equipment damage due to transients, and data corruption. Table 2-3 lists some general grounding practice guidelines.

<tr>
<td>Existing commercial building is not subject to natural environmental noise or man-made industrial noise. This building contains a standard office environment.</td>
<td>Low</td>
<td>Electromagnetic noise problems are not anticipated, but installing a grounding system is always recommended. Best grounding recommendations should be followed as much as possible.</td>
</tr>
</tbody>
</table>
In all situations, grounding practices must comply with local National Electric Code (NEC) requirements or local laws and regulations.

Always ensure that all of the modules are completely installed and that the captive installation screws are fully tightened. In addition, ensure that all I/O cables and power cords are properly seated. These practices are normal installation practices and must be followed in all installations.

Preventing Electrostatic Discharge Damage

Electrostatic discharge (ESD) damage, which can occur when modules or other FRUs are improperly handled, results in intermittent or complete failures. Modules consist of printed circuit boards that are fixed in metal carriers. Electromagnetic interference (EMI) shielding and connectors are integral components of the carrier. Although the metal carrier helps to protect the board from ESD, always use an ESD grounding strap when handling modules.

For preventing ESD damage, follow these guidelines:

- Always use an ESD wrist strap and ensure that it makes maximum contact with bare skin.
- ESD grounding straps are available with banana plugs, metal spring clips, or alligator clips. All Cisco Nexus 5000 Series chassis are equipped with a banana plug connector (identified by the ground symbol next to the connector) somewhere on the front panel. We recommend that you use a personal ESD grounding strap equipped with a banana plug.
- If you choose to use the disposable ESD wrist strap supplied with most FRUs or an ESD wrist strap equipped with an alligator clip, you must attach the system ground lug to the chassis in order to provide a proper grounding point for the ESD wrist strap.

This system ground is also referred to as the network equipment building system (NEBS) ground.

- If your chassis does not have the system ground attached, you must install the system ground lug. See “Establishing the System Ground” section on page 2-14 for installation instructions and location of the chassis system ground pads.

You do not need to attach a supplemental system ground wire to the system ground lug; the lug provides a direct path to the bare metal of the chassis.

After you install the system ground lug, follow these steps to correctly attach the ESD wrist strap:

**Step 1** Attach the ESD wrist strap to bare skin as follows:

a. If you are using the ESD wrist strap supplied with the FRUs, open the wrist strap package and unwrap the ESD wrist strap. Place the black conductive loop over your wrist and tighten the strap so that it makes good contact with your bare skin.

b. If you are using an ESD wrist strap equipped with an alligator clip, open the package and remove the ESD wrist strap. Locate the end of the wrist strap that attaches to your body and secure it to your bare skin.
Step 2 Grasp the spring or alligator clip on the ESD wrist strap and momentarily touch the clip to a bare metal spot (unpainted surface) on the rack. We recommend that you touch the clip to an unpainted rack rail so that any built-up static charge is then safely dissipated to the entire rack.

Step 3 Attach either the spring clip or the alligator clip to the ground lug screw as follows (See Figure 2-7):

a. If you are using the ESD wrist strap that is supplied with the FRUs, squeeze the spring clip jaws open, position the spring clip to one side of the system ground lug screw head, and slide the spring clip over the lug screw head so that the spring clip jaws close behind the lug screw head.

   **Note** The spring clip jaws do not open wide enough to fit directly over the head of the lug screw or the lug barrel.

b. If you are using an ESD wrist strap that is equipped with an alligator clip, attach the alligator clip directly over the head of the system ground lug screw or to the system ground lug barrel.

The following illustration displays how to attach the ESD Wrist Strap to the System Ground Lug Screw for the 5020 switch. Follow the same procedure for the 5010 switch.

</table>
In addition, follow these guidelines when handling modules:

- Handle carriers by available handles or edges only; avoid touching the printed circuit boards or connectors.
- Place a removed component board-side-up on an antistatic surface or in a static-shielding container. If you plan to return the component to the factory, immediately place it in a static-shielding container.
- Never attempt to remove the printed circuit board from the metal carrier.

**Caution**
For safety, periodically check the resistance value of the antistatic strap. The measurement should be between 1 and 10 megohm (Mohm).

### Establishing the System Ground

This section describes how to connect a system ground to the Cisco Nexus 5000 switch.

**Note**
This system ground is also referred to as the network equipment building system (NEBS) ground.

You must use the system (NEBS) ground on AC-powered systems if you are installing this equipment in a U.S. or European Central Office.

The system (NEBS) ground provides additional grounding for EMI shielding requirements and grounding for the low-voltage supplies (DC-DC converters) on the modules, and is intended to satisfy the Telcordia Technologies NEBS requirements for supplemental bonding and grounding connections. You must observe the following system grounding guidelines for your chassis:

- You must install the system (NEBS) ground connection with any other rack or system power ground connections that you make. The system ground connection is required if this equipment is installed in a U.S. or European Central Office.
- You must connect both the system (NEBS) ground connection and the power supply ground connection to an earth ground. The system (NEBS) ground connection is required if this equipment is installed in a U.S. or European Central Office.
- You do not need to power down the chassis because the Cisco Nexus 5020 switch is equipped with AC-input power supplies.

### Required Tools and Equipment

To connect the system ground, you need the following tools and materials:

- **Grounding lug**—A two-hole standard barrel lug. Supports up to 6 AWG wire. Supplied as part of the accessory kit.
- **Grounding screws**—Two M4 x 8mm (metric) pan-head screws. Supplied as part of the accessory kit.
- **Grounding wire**—Not supplied as part of the accessory kit. The grounding wire should be sized according to local and national installation requirements. Depending on the power supply and system, a 12 AWG to 6 AWG copper conductor is required for U.S. installations. Commercially available 6 AWG wire is recommended. The length of the grounding wire depends on the proximity of the switch to proper grounding facilities.
- **No. 1 Phillips screwdriver**.
Grounding the Chassis

The chassis has a grounding pad with two threaded M4 holes for attaching a grounding lug. Figure 2-8 shows the system ground location on the Cisco Nexus 5020 switch. It is identical for the Cisco Nexus 5010 switch.

⚠️ Warning
When installing or replacing the unit, the ground connection must always be made first and disconnected last. Statemanent 1046

⚠️ Caution
We recommend grounding the chassis, even if the rack is already grounded.

⚠️ Caution
All power supplies must be grounded. The receptacles of the AC power cables used to provide power to the chassis must be the grounding type, and the grounding conductors should connect to protective earth ground at the service equipment.
## Grounding the Chassis

### Warning
When installing or replacing the unit, the ground connection must always be made first and disconnected last.
Statement 1046

### Caution
Grounding the chassis is required if you are using DC power supplies, even if the rack is already grounded. A grounding pad with two threaded M4 holes is provided on the chassis for attaching a grounding lug. The ground lug must be NRTL listed. In addition, the copper conductor (wires) must be used and the copper conductor must comply with NEC code for ampacity.

To attach the grounding lug and cable to the chassis, follow these steps:

<table>

<tr>
<td>Step 1</td>
<td>Use a wire-stripping tool to remove approximately 0.75 inches (19 mm) of the covering from the end of the grounding cable.</td>

<td>Insert the stripped end of the grounding cable into the open end of the grounding lug.</td>
</tr>
<tr>

Starting the Switch

This section provides instructions for powering up the switch and verifying component installation.

**Note**

Do not connect the Ethernet port to the LAN until the initial switch configuration has been performed. For instructions on configuring the switch, see the *Cisco Nexus 5000 Series CLI Configuration Guide*. For instructions on connecting to the console port, see the “Connecting to the Console Port” section on page 3-2.

**Warning**

When installing or replacing the unit, the ground connection must always be made first and disconnected last.
Statement 1046

To power up the switch and verify hardware operation, follow these steps:

**Step 1**
Verify that empty power supply slots have filler panels installed, the faceplates of all modules are flush with the front of the chassis, and the captive screws of the power supplies, fan module, and all expansion modules are tight.

**Step 2**
Verify that the power supply and the fan modules are installed.

**Note**
Depending on the outlet receptacle on your power distribution unit, you may need the optional jumper power cord to connect the Cisco Nexus 5000 switch to your outlet receptacle. See the “Jumper Power Cord” section on page C-10.

**Step 3**
Ensure that the switch is adequately grounded as described in the “Grounding the System” section on page 2-10, and that the power cables are connected to outlets that have the required AC power voltages (see the “Power Specifications” section on page B-2).

**Step 4**
Connect the power cable to an AC power source. The switch should power on as soon as you connect the power cable.

**Step 5**
Listen for the fans; they should begin operating when the power cable is plugged in.
STEP 6 After the switch boots, verify that the LED operation is as follows:

- Fan module—Status LED is green.
- Power supply—Status LED is green.
- After initialization, the system status LED is green, indicating that all chassis environmental monitors are reporting that the system is operational. If this LED is orange or red, then one or more environmental monitor is reporting a problem.
- The Link LEDs for the Ethernet connector should not be on unless the cable is connected.

**Note** The link LEDs for the Fibre Channel ports remain yellow until the ports are enabled, and the LED for the Ethernet connector port remains off until the port is connected.

STEP 7 Try removing and reinstalling a component that is not operating correctly. If it still does not operate correctly, contact your customer service representative for a replacement.

**Note** If you purchased this product through a Cisco reseller, contact the reseller directly for technical support. If you purchased this product directly from Cisco, contact Cisco Technical Support at this URL: [http://www.cisco.com/warp/public/687/Directory/DirTAC.shtml](http://www.cisco.com/warp/public/687/Directory/DirTAC.shtml).

STEP 8 Verify that the system software has booted and the switch has initialized without error messages.

If any problems occur, see Appendix E, “Troubleshooting Hardware Components”. If you cannot resolve an issue, contact your customer service representative.

STEP 9 Complete the worksheets provided in Appendix D, “Site Planning and Maintenance Records” for future reference.

**Note** A setup utility automatically launches the first time you access the switch and guides you through the basic configuration. For instructions on how to configure the switch and check module connectivity, see the Cisco Nexus 5000 Series CLI Configuration Guide or the Cisco Nexus 5000 Series Fabric Manager Configuration Guide.

### Removing and Installing Power Supplies

The Cisco Nexus 5000 switch supports two front-end power supplies, but it may be used with one power supply.

This section includes the following topics:

- Removing a Power Supply, page 2-21

**Note**

You can replace a faulty power supply while the system is operating provided the other power supply is functioning.

### Removing a Power Supply

**Caution**

If you are using the Cisco Nexus 5000 switch with one power supply, removing the power supply will cause the switch to shut down. If you are using two power supplies and you remove one of them, the switch will continue to operate.

To remove a power supply, follow these steps:

- **Step 1** Grasp the power supply handle with your left hand.
- **Step 2** Push against the release latch with your left thumb and slide the power supply out of the chassis. See Figure 2-11 and Figure 2-12.
- **Step 3** Place your right hand under the power supply to support it while you slide it out of the chassis.
Step 4  Install a blank power supply filler panel if the power supply bay is to remain empty.

**Figure 2-12  Removing the Power Supply for the 5010**

### Installing a Power Supply

To install a power supply, follow these steps:

**Step 1**  Ensure that the system (earth) ground connection has been made. For ground connection instructions, see the “Grounding the System” section on page 2-10.
Removing and Installing Components

**Step 2** If the power supply bay has a filler panel, press the latches on the sides of the filler panel, and then slide it out of the power supply bay.

**Step 3** Hold the power supply by the handle and position it so that the release latch is on the right, and then slide it into the power supply bay, ensuring that the power supply is fully seated in the bay.

**Step 4** Plug the power cable into the AC inlet connector at the rear of the chassis.

---

**Note** Depending on the outlet receptacle on your power distribution unit, you may need the optional jumper power cord to connect the Cisco Nexus 5000 switch to your outlet receptacle. See the “Jumper Power Cord” section on page C-10.

**Step 5** Connect the other end of the power cable to an AC power source.

**Caution** In a system with dual power supplies, connect each power supply to a separate power source. In case of a power source failure, the second source will most likely still be available.

**Step 6** Verify power supply operation by checking that the power supply LED is green.

Removing and Installing the Fan Module

The fan module is designed to be removed and replaced while the system is operating without presenting an electrical hazard or damage to the system, provided the replacement is performed promptly.

This section includes the following topics:

Removing a Fan Module

Warning When removing the fan tray, keep your hands and fingers away from the spinning fan blades. Let the fan blades completely stop before you remove the fan tray. Statement 258
To remove a fan module, follow these steps:

**Step 1** Loosen the captive screws on the fan module by turning them counterclockwise, using a flat-blade or number 2 Phillips screwdriver if required.

**Step 2** Grasp the handle of fan module and pull it outward.

**Step 3** Pull the fan module clear of the chassis.

### Installing a Fan Module

To install a fan module, follow these steps:

**Step 1** Hold the fan module with the LED at the bottom.

**Step 2** Place the fan module into the front chassis cavity so it rests on the chassis, and then push the fan module into the chassis as far as it can go and the captive screw makes contact with the chassis, and tighten the captive screw.

**Step 3** Listen for the fans if the switch is powered on. You should immediately hear them operating. If you do not hear them, ensure that the fan module is inserted completely in the chassis and the faceplate is flush with the outside surface of the chassis.

**Step 4** Verify that the LED is green. If the LED is not green, one or more fans are faulty. If this occurs, contact your customer service representative for a replacement part.

### Removing the Cisco Nexus 5000 Switch

**Caution**
The slider rail and front rack-mount brackets do not have a stop mechanism when sliding in and out. If the front of the chassis is unfastened from the rack and the chassis slides forward on the slider rails, it may slip off the end of the rails and fall out of the rack.

To remove the Cisco Nexus 5000 switch from a rack, follow these steps:

**Step 1** Ensure that the weight of the Cisco Nexus 5000 switch is fully supported and that the switch is being held by another person.

**Step 2** Disconnect the power cord and the console cables.

**Step 3** Disconnect all cables that are connected to SFP+ transceivers.

**Step 4** Remove the screws fastening the front rack-mount brackets to the mounting rails.
Repacking the Cisco Nexus 5000 Switch for Return Shipment

If you need to return the Cisco Nexus 5000 switch, remove the switch from the rack by following the steps in “Removing the Cisco Nexus 5000 Switch” section on page 2-25, and repack it for shipment. If possible, use the original packing materials and container to repack the switch. Contact your Cisco customer service representative to arrange for return shipment to Cisco.
Connecting the Cisco Nexus 5000 Switch

The Cisco Nexus 5000 switch provides the following types of ports:

- Console port — An RS-232 port that you can use to create a local management connection.
- Ethernet ports, both encrypted and unencrypted—These ports can be used to connect to a LAN.
- Fibre Channel ports—These ports can be used to connect to a SAN.

**Caution**

When running power and data cables in overhead or subfloor cable trays, Cisco Systems strongly recommends that power cables and other potential noise sources must be located as far away as practical from network cabling that terminates on Cisco Systems equipment. In situations where long parallel cable runs cannot be separated by at least 3.3 ft (1 m), Cisco Systems recommends shielding any potential noise sources by housing them in a grounded metallic conduit.

This chapter includes the following topics:

- Preparing for Network Connections, page 3-2
- Connecting to the Console Port, page 3-2
- Connecting to the Ethernet Connector Port, page 3-3
- Connecting to an Ethernet Port, page 3-4
- Connecting to a Fibre Channel Port, page 3-7
Preparing for Network Connections

When preparing your site for network connections to the Cisco Nexus 5000 switch, consider the following for each type of interface, and gather all the required equipment before connecting the ports:

- Cabling required for each interface type
- Distance limitations for each signal type
- Additional interface equipment required

Connecting to the Console Port

The console port is an RS-232 port with an RJ-45 interface. (See Figure 3-1.) The console port is an asynchronous (async) serial port; any device connected to this port must be capable of asynchronous transmission.

We recommend using this port to create a local management connection to set the IP address and other initial configuration settings before connecting the switch to the network for the first time.

Caution

The console port can be used to connect to a modem. If you do not connect it to a modem, connect it either before powering the switch on or after the switch has completed the boot process.

Figure 3-1 shows how to connect to the console port on the Cisco Nexus 5020 switch. The process is identical for the Cisco Nexus 5010 switch.

You can use the console port to perform the following:

- Configure the Cisco Nexus 5000 switch from the CLI.
- Monitor network statistics and errors.
- Configure SNMP agent parameters.
- Download software updates.
You can use the console port to perform the following:

- Configure the Cisco Nexus 5010 switch from the CLI.
- Monitor network statistics and errors.
- Configure SNMP agent parameters.
- Download software updates.

**Note**
To connect the console port to a computer terminal, the computer must support VT100 terminal emulation. The terminal emulation software (frequently an application such as HyperTerminal or Procomm Plus) makes communication between the Cisco Nexus 5000 switch and a computer possible during setup and configuration.

To connect the console port to a computer terminal, follow these steps:

1. **Step 1** Configure the terminal emulator program to match the following default port characteristics: 9600 baud, 8 data bits, 1 stop bit, no parity.
2. **Step 2** Connect the RJ-45 connector of the console cable to the console port (see Figure 3-1) and the DB-9 connector to the computer serial port.

**Note** For configuration instructions, see the *Cisco Nexus 5000 Series CLI Configuration Guide*.

### Connecting to the Ethernet Connector Port

**Caution**
To prevent an IP address conflict, do not connect the management port to the network until the initial configuration is complete. For configuration instructions, see the *Cisco Nexus 5000 Series Switch Configuration Guide*.

The Ethernet connector port has an RJ-45 interface.

To connect the Ethernet connector port to an external hub, switch, or router, follow these steps:

1. **Step 1** Connect the appropriate modular cable to the Ethernet connector port:
   - Use modular, RJ-45, straight-through UTP cables to connect the Ethernet connector port to an Ethernet switch port or hub.
   - Use a cross-over cable to connect to a router interface.
2. **Step 2** Connect the other end of the cable to the device.
Connecting to an Ethernet Port

Use an SFP+ transceiver to connect to an Ethernet port, as described in this section.

Removing and Installing SFP+ Transceivers

Caution
Excessively removing and installing an SFP transceiver can shorten its life. Do not remove and insert SFP transceivers more often unless it is absolutely necessary. We recommend disconnecting cables before installing or removing SFP transceivers to prevent damage to the cable or transceiver.

This section describes the proper method for installing and removing an SFP+ transceiver.

Installing an SFP+ Transceiver

To install an SFP+ transceiver, follow these steps:

Step 1
Attach an ESD-preventive wrist strap and follow its instructions for use.

Step 2
Remove the dust cover from the port cage.

Step 3
Remove the dust cover from the port end of the transceiver.

Step 4
Insert the transceiver into the port:

- If the transceiver has a Mylar tab, position the transceiver with the tab on the bottom, and then gently insert the transceiver into the port until it clicks into place.
- If the transceiver has a bale clasp, position the transceiver with the clasp on the bottom, close the clasp by pushing it up over the transceiver, and then gently insert the transceiver into the port until it clicks into place.

Caution
If the transceiver does not install easily, ensure that it is correctly positioned and the tab or clasp are in the correct position before continuing.

Note
If you cannot install the cable into the transceiver, insert or leave the dust plug in the cable end of the transceiver.

Removing an SFP+ Transceiver

To remove an SFP+ transceiver, follow these steps:

Step 1
Attach an ESD-preventive wrist strap and follow its instructions for use.

Step 2
If a cable is installed in the transceiver:

a. Record the cable and port connections for later reference.
b. Press the release latch on the cable, grasp the connector near the connection point, and gently pull the connector from the transceiver.

c. Insert a dust plug into the cable end of the transceiver.

**Caution**  If the transceiver does not remove easily in the next step, push the transceiver completely in and then ensure that the latch is in the correct position before continuing.

**Step 3** Remove the transceiver from the port:

- If the transceiver has a Mylar tab latch, gently pull the tab straight out (do not twist), and then pull the transceiver out of the port.
- If the transceiver has a bale clasp latch, open the clasp by pressing it downwards, and then pull the transceiver out of the port.

**Note** If you have difficulty removing a bale clasp SFP+ transceiver, you should reseat it by returning the bale clasp to the up position. Press the SFP+ transceiver inward and upward into the cage. Next, lower the bale clasp and pull the SFP+ transceiver straight out with a slight upward lifting force (see Figure 3-2). Be careful not to damage the port cage during this process.

**Figure 3-2  Alternate Removal Method for Bale Clasp SFP+ Transceivers**

---

**Step 4** Insert a dust cover into the port end of the transceiver and place the transceiver on an antistatic mat or into a static shielding bag if you plan to return it to the factory.

**Step 5** If another transceiver is not being installed, protect the optical cage by inserting a clean cover.
Removing and Installing Cables into SFP+ Transceivers

Caution
To prevent damage to the copper cables, do not place more tension on them than the rated limit and do not bend to a radius of less than 1 inch if there is no tension in the cable, or 2 inches if there is tension in the cable.

Installing a Cable into an SFP+ Transceiver

Caution
To prevent possible damage to the cable or transceiver, install the transceiver in the port before installing the cable in the transceiver.

To install a cable into a transceiver, follow these steps:

Step 1 Attach an ESD-preventive wrist strap and follow its instructions for use.
Step 2 Remove the dust cover from the connector on the cable.
Step 3 Remove the dust cover from the cable end of the transceiver.
Step 4 Align the cable connector with the transceiver and insert the connector into the transceiver until it clicks into place.

Caution
If the cable does not install easily, ensure that it is correctly positioned before continuing.

For instructions on verifying connectivity, see the Cisco Nexus 5000 Switch Configuration Guide.

Removing a Cable from an SFP+ Transceiver

Caution
When pulling a cable from a transceiver, grip the body of the connector. Do not pull on the jacket sleeve, because this action can compromise the fiber-optic termination in the connector.

Caution
If the cable does not remove easily, ensure that any latch present on the cable has been released before continuing.

To remove the cable, follow these steps:

Step 1 Attach an ESD-preventive wrist strap and follow its instructions for use.
Step 2 Press the release latch on the cable, grasp the connector near the connection point, and gently pull the connector from the transceiver.
Step 3 Insert a dust plug into the cable end of the transceiver.
Connecting to a Fibre Channel Port

Use an SFP transceiver to connect to a Fibre Channel port.

Removing and Installing SFP Transceivers

Excessively removing and installing an SFP transceiver can shorten its life. Do not remove and insert SFP transceivers more often unless it is absolutely necessary. Cisco recommends disconnecting cables before installing or removing SFP transceivers to prevent damage to the cable or transceiver.

This section describes the proper method for installing and removing an SFP transceiver.

Installing an SFP Transceiver

To install an SFP transceiver, follow these steps:

Step 1 Attach an ESD-preventive wrist strap and follow its instructions for use.

Maintaining SFP+ Transceivers and Cables

SFP+ transceivers must be kept clean and dust-free to maintain high signal accuracy and prevent damage to the connectors. Attenuation (loss of light) is increased by contamination and should be below 0.35 dB.

Consider the following maintenance guidelines:

- SFP+ transceivers are static sensitive. To prevent ESD damage, wear an ESD-preventive wrist strap that is connected to the chassis.
- Do not remove and insert a transceiver more often than is necessary. Repeated removals and insertions can shorten its useful life.
- Keep all optical connections covered when not in use. If they become dusty, clean before using to prevent dust from scratching the fiber-optic cable ends.
- Do not touch ends of connectors to prevent fingerprints and other contamination.
- Clean regularly; the required frequency of cleaning depends upon the environment. In addition, clean connectors if they are exposed to dust or accidentally touched. Both wet and dry cleaning techniques can be effective; refer to your site’s fiber-optic connection cleaning procedure.
- Inspect routinely for dust and damage. If damage is suspected, clean and then inspect fiber ends under a microscope to determine if damage has occurred.

Step 4 Insert a dust plug onto the end of the cable.
Connecting to a Fibre Channel Port

Step 2   Remove the dust cover from the port cage.
Step 3   Remove the dust cover from the port end of the transceiver.
Step 4   Insert the transceiver into the port:
  • If the transceiver has a Mylar tab, position the transceiver with the tab on the bottom, and then gently insert the transceiver into the port until it clicks into place.
  • If the transceiver has a bale clasp, position the transceiver with the clasp on the bottom, close the clasp by pushing it up over the transceiver, and then gently insert the transceiver into the port until it clicks into place.

Caution   If the transceiver does not install easily, ensure that it is correctly positioned and the tab or clasp are in the correct position before continuing.

Note   If you cannot install the cable into the transceiver, insert or leave the dust plug in the cable end of the transceiver.

  b. Press the release latch on the cable, grasp the connector near the connection point, and gently pull the connector from the transceiver.
  c. Insert a dust plug into the cable end of the transceiver.

Caution   If the transceiver does not remove easily in the next step, push the transceiver completely in and then ensure that the latch is in the correct position before continuing.

Step 3   Remove the transceiver from the port:
  • If the transceiver has a Mylar tab latch, gently pull the tab straight out (do not twist), and then pull the transceiver out of the port.
  • If the transceiver has a bale clasp latch, open the clasp by pressing it downwards, and then pull the transceiver out of the port.

Note   If you have difficulty removing a bale clasp SFP transceiver, you should reseat the SFP by returning the bale clasp to the up position. Press the SFP inward and upward into the cage. Next, lower the bale clasp and pull the SFP straight out with a slight upward lifting force (see Figure 3-3). Be careful not to damage the port cage during this process.
Step 4 Insert a dust cover into the port end of the transceiver and place the transceiver on an antistatic mat or into a static-shielding bag if you plan to return it to the factory.

Step 5 If another transceiver is not being installed, protect the optical cage by inserting a clean cover.

Cabinet and Rack Installation

This appendix provides the requirements for cabinet and rack installation and includes the following sections:

- Cable Management Guidelines, page A-3

Cabinet and Rack Requirements

This section provides the requirements for the following types of cabinets and racks, assuming an external ambient air temperature range of 0 to 104°F (0 to 40°C):

- Standard perforated cabinets
- Solid-walled cabinets with a roof fan tray (bottom to top cooling)
- Standard open racks

**Note**

If you are selecting an enclosed cabinet, we recommend one of the thermally validated types: standard perforated or solid-walled with a fan tray.

**Note**

Do not use racks that have obstructions (such as power strips), because the obstructions could impair access to field-replaceable units (FRUs).

General Requirements for Cabinets and Racks

The cabinet or rack must be one of the following types:

- Standard 19-in. (48.3 cm) (four-post EIA cabinet or rack, with mounting rails that conform to English universal hole spacing per section 1 of ANSI/EIA-310-D-1992. See the “Requirements Specific to Perforated Cabinets” section on page A-2 and the “Requirements Specific to Solid-Walled Cabinets” section on page A-3.

The cabinet or rack must also meet the following requirements:

- The minimum vertical rack space per 5020 chassis must be two RU (rack units), equal to 3.50 inches (8.9 cm).
The minimum vertical rack space per 5010 chassis must be one RU (rack unit), equal to 1.75 inches (4.4 cm).

The width between the rack-mounting rails must be at least 17.75 inches (45.1 cm) if the rear of the switch is not attached to the rack. For four-post EIA racks, this is the distance between the two front rails.

For four-post EIA cabinets (perforated or solid-walled):

- The minimum spacing for the bend radius for fiber-optic cables should have the front-mounting rails of the cabinet offset from the front door by a minimum of 3 inches (7.6 cm), and a minimum of 5 inches (12.7 cm) if cable management brackets are installed on the front of the chassis.

- The distance between the outside face of the front mounting rail and the outside face of the back mounting rail should be 23.5 to 34.0 inches (59.7 to 86.4 cm) to allow for rear-bracket installation.

- A minimum of 2.5 inches (6.4 cm) of clear space should exist between the side edge of the chassis and the side wall of the cabinet. No sizeable flow obstructions should be immediately in the way of chassis air intake or exhaust vents.

**Note**
Optional jumper power cords are available for use in a cabinet. See the “Jumper Power Cord” section on page C-10.

### Requirements Specific to Perforated Cabinets

A perforated cabinet is defined here as a cabinet with perforated front and rear doors and solid side walls. In addition to the requirements listed in the “General Requirements for Cabinets and Racks” section on page A-1, perforated cabinets must meet the following requirements:

- The front and rear doors must have at least a 60 percent open area perforation pattern, with at least 15 square inches of open area per rack unit of door height.

- The roof should be perforated with at least a 20 percent open area.

- The cabinet floor should be open or perforated to enhance cooling.

A perforated cabinet that conforms to these requirements is available from Rittal Corporation:

**Rittal Corporation**

A solid-walled cabinet is defined here as a cabinet with solid front and rear doors and solid side walls. In addition to the requirements listed in the “General Requirements for Cabinets and Racks” section on page A-1, solid-walled cabinets must meet the following requirements:

- A roof-mounted fan tray and an air cooling scheme in which the fan tray pulls air in at the bottom of the cabinet and exhausts it out the top, with a minimum of 500 cubic feet per minute of airflow exiting the cabinet roof through the fan tray.
- Nonperforated (solid and sealed) front and back doors and side panels so that air travels predictably from bottom to top.
- A recommended cabinet depth of 36 to 42 inches (91.4 to 106.7 cm) to allow the doors to close and for adequate airflow.
- A minimum of 150 sq. inches (968 sq. cm) of open area at the floor air intake of the cabinet.
- The lowest piece of equipment should be installed a minimum of 1.75 inches (4.4 cm) above the floor openings to prevent blocking the floor intake.

Requirements Specific to Standard Open Racks

In addition to the requirements listed in the “General Requirements for Cabinets and Racks” section on page A-1, if mounting the chassis in an open rack (no side panels or doors), ensure that the rack meets the following requirements:

- The minimum vertical rack space per chassis must be two RU (rack unit), equal to 3.47 inches (8.8 cm).
- The horizontal distance between the chassis and any adjacent chassis should be 6 inches (15.2 cm), and the distance between the chassis air vents and any walls should be 2.5 inches (6.4 cm).

Cable Management Guidelines

To help with cable management, you might want to allow additional space in the rack above and below the chassis to make it easier to route as many as 56 fiber or copper cables through the rack.

The current power supply in the Nexus 5020 has a label for 200-240V. However, it has since been certified to support 110V input as well. As a result, both 110V and 220V inputs are supported and the labels on the chassis moving forwards will reflect this capability. A new software release will be required to support this capability.

Specifications for the Cisco Nexus 5010 Power Supply

The power supplies connect to the system through panel mount connectors and connectors attach to the baseboard through cables. There are total of 3 connectors on the baseboard, two for power delivery, and one for power supply control signals. Table B-6 lists the specifications for the Cisco Nexus 5010 power supply.

Supported Power Cords and Plugs

Each power supply has a separate power cord. Standard power cords or jumper power cords are available for connection to a power distribution unit having IEC 60320 C19 outlet receptacles. The jumper power cords, for use in cabinets, are available as an optional alternative to the standard power cords.

Power Cords

The standard power cords have an IEC C13 connector on the end that plugs into the switch. The optional jumper power cords have an IEC C13 connector on the end that plugs into the switch, and an IEC C14 connector on the end that plugs into an IEC C13 outlet receptacle.

Only the regular power cords or jumper power cords provided with the switch are supported.

### Site Preparation Checklist

Planning the location and layout of your equipment rack or wiring closet is essential for successful switch operation, ventilation, and accessibility. Table D-1 lists the site planning tasks that we recommend completing before installing the Cisco Nexus 5000 switch.

Consider heat dissipation when sizing the air-conditioning requirements for an installation. See Table B-3 on page B-2 for the environmental requirements, and the “Power Specifications” section on page B-2 for power and heat ratings.

Troubleshooting Hardware Components

This appendix describes how to identify and resolve problems that might occur with the hardware components of the Cisco Nexus 5000 switch. It includes the following sections:

- Overview, page E-1
- SNMP Traps, page E-1
- Switch Hardware Best Practices, page E-1

Overview

The key to success when troubleshooting the system hardware is to isolate the problem to a specific system component. The first step is to compare what the system is doing to what it should be doing. Because a startup problem can usually be attributed to a single component, it is more efficient to isolate the problem to a subsystem rather than troubleshoot each separate component in the system.

Problems with the initial power up are often caused by a module that is not firmly connected to the backplane or a power supply that has been disconnected from the power cord connector.

Overheating can also cause problems with the system, though typically only after the system has been operating for an extended period of time. The most common cause of overheating is the failure of a fan module.

SNMP Traps

You can set SNMP traps to monitor fans, power supplies, and temperature settings, or to test a call home application. Use the following commands to set SNMP traps:

- test pfmentest-SNMP-trap fan
- test pfmentest-SNMP-trap power supply
- test pfmentest-SNMP-trap temp-sensor

Switch Hardware Best Practices

Use the recommendations in this section to ensure the proper installation, initialization, and operation of the switch. This section includes the following topics:
Installation Best Practices

When installing the switch, follow these best practices:

- Plan your site configuration and prepare the site before installing the chassis.
- Verify that you have the appropriate power supplies for your chassis configuration.
- Install the chassis following the rack and airflow guidelines presented in this guide.
- Verify that the chassis is adequately grounded.

Initialization Best Practices

When the initial system boot is complete, verify the following:

- Power supplies are supplying power to the system. See the
- Fan modules are operating normally. See the
- The system software boots successfully. See the Cisco Nexus 5020 CLI Configuration Guide for information about booting the system and initial configuration task.

Switch Operation Best Practices

To ensure proper operation of your switch, take the following actions:

- Make a copy of the running configuration to CompactFlash for a safe backup.
- Always enter the `copy running-config startup-config` CLI command after you modify the running configuration and ensure that the system is operating properly.
- Never use the `init system` CLI command unless you understand that you will lose the running and startup configuration as well as the files stored on bootflash:
- Keep backup copies of the running kickstart and the system images on CompactFlash.
